OVERVIEW

PCB, PCM and PCH Overview

The PCB, PCM, and PCH are separate compilers. PCB is for 12-bit opcodes, PCM is for 14-bit opcodes, and PCH is for 16-bit opcode PIC® microcontrollers. Due to many similarities, all three compilers are covered in this reference manual. Features and limitations that apply to only specific microcontrollers are indicated within. These compilers are specifically designed to meet the unique needs of the PIC® microcontroller. This allows developers to quickly design applications software in a more readable, high-level language.

IDE Compilers (PCW, PCWH and PCWHD) have the exclusive C Aware integrated development environment for compiling, analyzing and debugging in real-time. Other features and integrated tools can be viewed in the help file.

When compared to a more traditional C compiler, PCB, PCM, and PCH have some limitations. As an example of the limitations, function recursion is not allowed. This is due to the fact that the PIC® has no stack to push variables onto, and also because of the way the compilers optimize the code. The compilers can efficiently implement normal C constructs, input/output operations, and bit twiddling operations. All normal C data types are supported along with pointers to constant arrays, fixed point decimal, and arrays of bits.

Installation

1. Insert the CD ROM, select each of the programs you wish to install and follow the on-screen instructions.

2. If the CD does not auto start run the setup program in the root directory.

3. For help answering the version questions see the "Directories" Help topic.

4. Key Questions that may come up:
   - Keep Settings- Unless you are having trouble select this
   - Link Compiler Extensions- If you select this the file extensions like .c will start the compiler IDE when you double click on files with that extension. .hex files start
CCS C Compiler

- the CCSLOAD program. This selection can be change in the IDE.
- Install MP LAB Plug In- If you plan to use MPLAB and you don't select this you will need to download and manually install the Plug-In.
- Install ICD2, ICD3...drivers-select if you use these microchip ICD units.
- Delete Demo Files- Always a good idea
- Install WIN8 APP- Allows you to start the IDE from the WIN8 Start Menu.

Technical Support

Compiler, software, and driver updates are available to download at:
http://www.ccsinfo.com/download

Compilers come with 30 or 60 days of download rights with the initial purchase. One year maintenance plans may be purchased for access to updates as released.

The intent of new releases is to provide up-to-date support with greater ease of use and minimal, if any, transition difficulty.

To ensure any problem that may occur is corrected quickly and diligently, it is recommended to send an email to: support@ccsinfo.com or use the Technical Support Wizard in PCW. Include the version of the compiler, an outline of the problem and attach any files with the email request. CCS strives to answer technical support timely and thoroughly.

Technical Support is available by phone during business hours for urgent needs or if email responses are not adequate. Please call 262-522-6500 x32.

Directories

The compiler will search the following directories for Include files.
- Directories listed on the command line
- Directories specified in the .CCSPJT file
- The same directory as the source.directories in the ccsc.ini file

By default, the compiler files are put in C:\Program Files\PICC and the example programs are in \PICC\EXAMPLES. The include files are in PICC\drivers. The device header files are in PICC\devices.

The compiler itself is a DLL file. The DLL files are in a DLL directory by default in \PICC\DLL.
Overview

It is sometimes helpful to maintain multiple compiler versions. For example, a project was tested with a specific version, but newer projects use a newer version. When installing the compiler you are prompted for what version to keep on the PC. IDE users can change versions using Help>about and clicking "other versions." Command Line users use start>all programs>PIC-C>compiler version.

Two directories are used outside the PICC tree. Both can be reached with start>all programs>PIC-C.

1.) A project directory as a default location for your projects. By default put in "My Documents." This is a good place for VISTA and up.

2.) User configuration settings and PCWH loaded files are kept in %APPDATA%\PICC

File Formats

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.c</td>
<td>This is the source file containing user C source code.</td>
</tr>
<tr>
<td>.h</td>
<td>These are standard or custom header files used to define pins, register, register bits, functions and preprocessor directives.</td>
</tr>
<tr>
<td>.pjt</td>
<td>This is the older pre-Version 5 project file which contains information related to the project.</td>
</tr>
<tr>
<td>.ccspjt</td>
<td>This is the project file which contains information related to the project.</td>
</tr>
<tr>
<td>.lst</td>
<td>This is the listing file which shows each C source line and the associated assembly code generated for that line. The elements in the .LST file may be selected in PCW under Options&gt;Project&gt;Output Files.</td>
</tr>
<tr>
<td>.sym</td>
<td>This is the symbol map which shows each register location and what program variables are stored in each location.</td>
</tr>
<tr>
<td>.sta</td>
<td>The statistics file shows the RAM, ROM, and STACK usage. It provides information on the source codes structural and textual complexities using Halstead and McCabe metrics.</td>
</tr>
</tbody>
</table>

<table>
<thead>

### CCS C Compiler

<table>
<thead>
<tr>
<th>Extension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.tre</td>
<td>The tree file shows the call tree. It details each function and what functions it calls along with the ROM and RAM usage for each function.</td>
</tr>
<tr>
<td>.hex</td>
<td>The compiler generates standard HEX files that are compatible with all programmers. The compiler can output 8-bit hex, 16-bit hex, and binary files.</td>
</tr>
<tr>
<td>.cof</td>
<td>This is a binary containing machine code and debugging information. The debug files may be output as Microchip .COD file for MPLAB 1-5, Advanced Transdata .MAP file, expanded .COD file for CCS debugging or MPLAB 6 and up .xx .COF file. All file formats and extensions may be selected via Options File Associations option in Windows IDE.</td>
</tr>
<tr>
<td>.cod</td>
<td>This is a binary file containing debug information.</td>
</tr>
<tr>
<td>.rtf</td>
<td>The output of the Documentation Generator is exported in a Rich Text File format which can be viewed using the RTF editor or Wordpad.</td>
</tr>
<tr>
<td>.rvf</td>
<td>The Rich View Format is used by the RTF Editor within the IDE to view the Rich Text File.</td>
</tr>
<tr>
<td>.dgr</td>
<td>The .DGR file is the output of the flowchart maker.</td>
</tr>
<tr>
<td>.esym</td>
<td>These files are generated for the IDE users. The file contains Identifiers and Comment information. This data can be used for automatic documentation generation and for the IDE helpers.</td>
</tr>
<tr>
<td>.xsym</td>
<td></td>
</tr>
<tr>
<td>.o</td>
<td>Relocatable object file</td>
</tr>
<tr>
<td>.osym</td>
<td>This file is generated when the compiler is set to export a relocatable object file. This file is a .sym file for just the one unit.</td>
</tr>
<tr>
<td>.err</td>
<td>Compiler error file</td>
</tr>
<tr>
<td>.ccsload</td>
<td>used to link Windows 8 apps to CCSLoad</td>
</tr>
<tr>
<td>.ccssio</td>
<td>used to link Windows 8 apps to Serial Port Monitor</td>
</tr>
</tbody>
</table>

### Invoking the Command Line Compiler

The command line compiler is invoked with the following command:

```
CCSC [options] [cfilename]
```

Valid options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+FB</td>
<td>Select PCB (12 bit)</td>
</tr>
<tr>
<td>-D</td>
<td>Do not create debug file</td>
</tr>
<tr>
<td>+FM</td>
<td>Select PCM (14 bit)</td>
</tr>
<tr>
<td>+DS</td>
<td>Standard .COD format debug file</td>
</tr>
</tbody>
</table>
## Overview

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+FH</td>
<td>Select PCH (PIC18XXX)</td>
</tr>
<tr>
<td>+Yx</td>
<td>Optimization level x (0-9)</td>
</tr>
<tr>
<td>+DM</td>
<td>.MAP format debug file</td>
</tr>
<tr>
<td>+DC</td>
<td>Expanded .COD format debug file</td>
</tr>
<tr>
<td>+DF</td>
<td>Enables the output of an COFF debug file.</td>
</tr>
<tr>
<td>+FS</td>
<td>Select SXC (SX)</td>
</tr>
<tr>
<td>+EO</td>
<td>Old error file format</td>
</tr>
<tr>
<td>+ES</td>
<td>Standard error file</td>
</tr>
<tr>
<td>-T</td>
<td>Do not generate a tree file</td>
</tr>
<tr>
<td>+T</td>
<td>Create call tree (.TRE)</td>
</tr>
<tr>
<td>-A</td>
<td>Do not create stats file (.STA)</td>
</tr>
<tr>
<td>+A</td>
<td>Create stats file (.STA)</td>
</tr>
<tr>
<td>-EW</td>
<td>Suppress warnings (use with +EA)</td>
</tr>
<tr>
<td>+EW</td>
<td>Show warning messages</td>
</tr>
<tr>
<td>+EA</td>
<td>Show all error messages and all warnings</td>
</tr>
<tr>
<td>+EX</td>
<td>Error/warning message format uses GCC's &quot;brief format&quot; (compatible with GCC editor environments)</td>
</tr>
</tbody>
</table>

The xxx in the following are optional. If included it sets the file extension:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+LNxxx</td>
<td>Normal list file</td>
</tr>
<tr>
<td>+O8xxx</td>
<td>8-bit Intel HEX output file</td>
</tr>
<tr>
<td>+LSxxx</td>
<td>MPASM format list file</td>
</tr>
<tr>
<td>+OWxxx</td>
<td>16-bit Intel HEX output file</td>
</tr>
<tr>
<td>+LOxxx</td>
<td>Old MPASM list file</td>
</tr>
<tr>
<td>+OBxxx</td>
<td>Binary output file</td>
</tr>
<tr>
<td>+LYxxx</td>
<td>Symbolic list file</td>
</tr>
<tr>
<td>-O</td>
<td>Do not create object file</td>
</tr>
<tr>
<td>-L</td>
<td>Do not create list file</td>
</tr>
<tr>
<td>-P</td>
<td>Keep compile status window up after compile</td>
</tr>
<tr>
<td>+Pxx</td>
<td>Keep status window up for xx seconds after compile</td>
</tr>
<tr>
<td>+PN</td>
<td>Keep status window up only if there are no errors</td>
</tr>
<tr>
<td>+PE</td>
<td>Keep status window up only if there are errors</td>
</tr>
<tr>
<td>+Z</td>
<td>Keep scratch files on disk after compile</td>
</tr>
<tr>
<td>+DF</td>
<td>COFF Debug file</td>
</tr>
<tr>
<td>I=&quot;...&quot;</td>
<td>Same as I=&quot;...&quot; Except the path list is appended to the current list</td>
</tr>
</tbody>
</table>

Set include directory search path, for example:

I="c:\picc\examples;c:\picc\myincludes"

If no I= appears on the command line the .PJF file will be used to supply the include file paths.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-P</td>
<td>Close compile window after compile is complete</td>
</tr>
<tr>
<td>+M</td>
<td>Generate a symbol file (.SYM)</td>
</tr>
<tr>
<td>-M</td>
<td>Do not create symbol file</td>
</tr>
<tr>
<td>+J</td>
<td>Create a project file (.PJF)</td>
</tr>
<tr>
<td>-J</td>
<td>Do not create PJF file</td>
</tr>
<tr>
<td>+ICD</td>
<td>Compile for use with an ICD</td>
</tr>
<tr>
<td>#xxx=&quot;yyy&quot;</td>
<td>Set a global #define for id xxx with a value of yyy, example: #debug=&quot;true&quot;</td>
</tr>
<tr>
<td>+Gxxx=&quot;yyy&quot;</td>
<td>Same as #xxx=&quot;yyy&quot;</td>
</tr>
<tr>
<td>+?</td>
<td>Brings up a help file</td>
</tr>
<tr>
<td>-?</td>
<td>Same as +?</td>
</tr>
</tbody>
</table>
CCS C Compiler

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+STDOUT</td>
<td>Outputs errors to STDOUT (for use with third party editors)</td>
</tr>
<tr>
<td>+SETUP</td>
<td>Install CCSC into MPLAB (no compile is done)</td>
</tr>
<tr>
<td>sourceline=</td>
<td>Allows a source line to be injected at the start of the source file.</td>
</tr>
<tr>
<td>Example:</td>
<td>CCSC +FM myfile.c sourceline=&quot;#include &lt;16F887.h&gt;&quot;</td>
</tr>
<tr>
<td>+V</td>
<td>Show compiler version (no compile is done)</td>
</tr>
<tr>
<td>+Q</td>
<td>Show all valid devices in database (no compile is done)</td>
</tr>
</tbody>
</table>

A / character may be used in place of a + character. The default options are as follows:

+FM +ES +J +DC +Y9 -T -A +M +LNlst +O8hex -P -Z

If @filename appears on the CCSC command line, command line options will be read from the specified file. Parameters may appear on multiple lines in the file.

If the file CCSC.INI exists in the same directory as CCSC.EXE, then command line parameters are read from that file before they are processed on the command line.

Examples:
```
CCSC +FM C:\PICSTUFF\TEST.C
CCSC +FM +P +T TEST.C
```

PCW Overview

The PCW IDE provides the user an easy to use editor and environment for developing microcontroller applications. The IDE comprises of many components, which are summarized below. For more information and details, use the Help>PCW in the compiler.

Many of these windows can be re-arranged and docked into different positions.

Menu

All of the IDE’s functions are on the main menu. The main menu is divided into separate sections, click on a section title ('Edit', 'Search', etc) to change the section. Double clicking on the section, or clicking on the chevron on the right, will cause the menu to minimize and take less space.
Editor Tabs

All of the open files are listed here. The active file, which is the file currently being edited, is given a different highlight than the other files. Clicking on the X on the right closes the active file. Right clicking on a tab gives a menu of useful actions for that file.

Slide Out Windows

'Files' shows all the active files in the current project. 'Projects' shows all the recent projects worked on. 'Identifiers' shows all the variables, definitions, prototypes and identifiers in your current project.

Editor

The editor is the main work area of the IDE and the place where the user enters and edits source code. Right clicking in this area gives a menu of useful actions for the code being edited.

Debugging Windows

Debugger control is done in the debugging windows. These windows allow you set breakpoints, single step, watch variables and more.
CCS C Compiler

**Status Bar**

The status bar gives the user helpful information like the cursor position, project open and file being edited.

**Output Messages**

Output messages are displayed here. This includes messages from the compiler during a build, messages from the programmer tool during programming or the results from find and searching.
Overall Structure

A program is made up of the following four elements in a file:
- Comment
- Pre-Processor Directive
- Data Definition
- Function Definition
  - Statements
  - Expressions

Every C program must contain a main function which is the starting point of the program execution. The program can be split into multiple functions according to their purpose and the functions could be called from main or the sub-functions. In a large project functions can also be placed in different C files or header files that can be included in the main C file to group the related functions by their category. CCS C also requires to include the appropriate device file using #include directive to include the device specific functionality. There are also some preprocessor directives like #fuses to specify the fuses for the chip and #use delay to specify the clock speed. The functions contain the data declarations, definitions, statements and expressions. The compiler also provides a large number of standard C libraries as well as other device drivers that can be included and used in the programs. CCS also provides a large number of built-in functions to access the various peripherals included in the PIC microcontroller.

Comment

Comments – Standard Comments
A comment may appear anywhere within a file except within a quoted string. Characters between /* and */ are ignored. Characters after a // up to the end of the line are ignored.

Comments for Documentation Generator
The compiler recognizes comments in the source code based on certain markups. The compiler recognizes these special types of comments that can be later exported for use in the documentation generator. The documentation generator utility uses a user selectable template to export these comments and create a formatted output document in Rich Text File Format. This utility is only available in the IDE version of the compiler. The source code markups are as follows.
Global Comments
These are named comments that appear at the top of your source code. The comment names are case sensitive and they must match the case used in the documentation template.
For example:
//*PURPOSE This program implements a Bootloader.
//*AUTHOR John Doe

A // followed by an * will tell the compiler that the keyword which follows it will be the named comment. The actual comment that follows it will be exported as a paragraph to the documentation generator.
Multiple line comments can be specified by adding a : after the *, so the compiler will not concatenate the comments that follow. For example:
/**:CHANGES
  05/16/06  Added PWM loop
  05/27.06  Fixed Flashing problem
*/

Variable Comments
A variable comment is a comment that appears immediately after a variable declaration.
For example:
int seconds; // Number of seconds since last entry
long day, // Current day of the month, /* Current Month */
long year; // Year

Function Comments
A function comment is a comment that appears just before a function declaration. For example:
// The following function initializes outputs
void function_foo()
{
    init_outputs();
}
Function Named Comments
The named comments can be used for functions in a similar manner to the Global Comments. These comments appear before the function, and the names are exported as-is to the documentation generator.
For example:
```c
//*PURPOSE This function displays data in BCD format
void display_BCD( byte n)
{
    display_routine();
}
```

Trigraph Sequences
The compiler accepts three character sequences instead of some special characters not available on all keyboards as follows:

<table>
<thead>
<tr>
<th>Sequence</th>
<th>Same as</th>
</tr>
</thead>
<tbody>
<tr>
<td>??=</td>
<td>#</td>
</tr>
<tr>
<td>??(</td>
<td>[</td>
</tr>
<tr>
<td>??/</td>
<td>\</td>
</tr>
<tr>
<td>??)</td>
<td>]</td>
</tr>
<tr>
<td>??'</td>
<td>^</td>
</tr>
<tr>
<td>??&lt;</td>
<td>{</td>
</tr>
<tr>
<td>??!</td>
<td></td>
</tr>
<tr>
<td>??&gt;</td>
<td>}</td>
</tr>
<tr>
<td>??-</td>
<td>~</td>
</tr>
</tbody>
</table>

Multiple Project Files
When there are multiple files in a project they can all be included using the #include in the main file or the sub-files to use the automatic linker included in the compiler. All the header files, standard libraries and driver files can be included using this method to automatically link them.

For example: if you have main.c, x.c, x.h, y.c,y.h and z.c and z.h files in your project, you can say in:

```
main.c
#include <device header file>
#include <x.c>
#include <y.c>
#include <z.c>
```
In this example there are 8 files and one compilation unit. Main.c is the only file compiled.

Note that the #module directive can be used in any include file to limit the visibility of the symbol in that file.

To separately compile your files see the section "multiple compilation units".

Multiple Compilation Units

Multiple Compilation Units are only supported in the IDE compilers, PCW, PCWH, PCHWD and PCDIDE. When using multiple compilation units, care must be given that pre-processor commands that control the compilation are compatible across all units. It is recommended that directives such as #FUSES, #USE and the device header file all put in an include file included by all units. When a unit is compiled it will output a relocatable object file (*.o) and symbol file (*.osym).

There are several ways to accomplish this with the CCS C Compiler. All of these methods and example projects are included in the MCU.zip in the examples directory of the compiler.

Full Example Program

Here is a sample program with explanation using CCS C to read adc samples over rs232:

```
EX_ADM.C

This program displays the min and max of 30 A/D samples over the RS-232 interface. The process is repeated forever.
```
Program Syntax

```c
/// If required configure the CCS prototype card as follows:   
/// Insert jumper from output of POT to pin A5         
/// Use a 10K POT to vary the voltage.               
/// Jumpers:                                          
/// PCM, PCH  pin C7 to RS232 RX, pin C6 to RS232 TX 
/// PCD      none                                    
/// This example will work with the PCM, PCH, and PCD compilers. 
/// The following conditional compilation lines are used to include a valid device for each compiler. Change the device, clock and RS232 pins for your hardware if needed.
#if defined(__PCM__)                                    // Preprocessor directive that chooses
    // the compiler
    #include <16F877.h>                              // Preprocessor directive that selects
            // the chip
    #fuses HS,NOWDT,NOPROTECT,NOLVP                 // Preprocessor directive that defines
            // the chip fuses
    #use delay(clock=20000000)                     // Preprocessor directive that specifies clock speed
    #use rs232(baud=9600, xmit=PIN_C6, rcv=PIN_C7) // Preprocessor directive that includes
            // RS232 libraries
#elif defined(__PCH__)                                   // Preprocessor directive
    #include <18F452.h>                              // Preprocessor directive
    #fuses HS,NOWDT,NOPROTECT,NOLVP                 // Preprocessor directive
    #use delay(clock=20000000)                     // Preprocessor directive
    #use rs232(baud=9600, xmit=PIN_C6, rcv=PIN_C7) // Preprocessor directive
    #fuses HS,NOWDT                                // Preprocessor directive
    #device ADC=8                                  // Preprocessor directive
    #use delay(clock=20000000)                     // Preprocessor directive
    #use rs232(baud=9600, UART1A)                  // Preprocessor directive
#endif

void main() {
    unsigned int8 i, value, min, max;
    printf("Sampling: ");                                   // Printf function included in RS232
    setup_adc_ports(AN0);
```
CCS C Compiler

    #endif

    setup_adc(ADC_CLOCK_INTERNAL); // Built-in A/D setup
    function
    set_adc_channel(0); // Built-in A/D setup
    function
    do {
        min=255;
        max=0;
        for(i=0; i<=30; ++i) {
            delay_ms(100); // Built-in delay function
            value = read_adc(); // Built-in A/D read function
            if(value<min)
                min=value;
            if(value>max)
                max=value;
        }
        printf("\r\nMin: %2X Max: %2X\n",min,max);
    } while (TRUE);
}
## Statements

<tr>
<td>declaration;</td>
<td></td>
</tr>
</tbody>
</table>

Note: Items in [ ] are optional.
if

if-else
The if-else statement is used to make decisions.
The syntax is:

```c
if (expr)
    stmt-1;
[else
    stmt-2;]
```

The expression is evaluated; if it is true stmt-1 is done. If it is false then stmt-2 is done.

else-if
This is used to make multi-way decisions.
The syntax is:

```c
if (expr)
    stmt;
[else if (expr)
    stmt;]
...
[else
    stmt;]
```

The expressions are evaluated in order; if any expression is true, the statement associated with it is executed and it terminates the chain. If none of the conditions are satisfied the last else part is executed.

Example:
```c
if (x==25)
    x=1;
else
    x=x+1;
```

Also See: Statements

while

While is used as a loop/iteration statement.
The syntax is:

```c
while (expr)
    statement
```
The expression is evaluated and the statement is executed until it becomes false in which case the execution continues after the statement.

Example:
while (get_rtcc() != 0)
    putc('n');

Also See: Statements

**do-while**

**do-while**: Differs from *while* and *for* loop in that the termination condition is checked at the bottom of the loop rather than at the top and so the body of the loop is always executed at least once. The syntax is:

```
do
    statement
while (expr);
```

The statement is executed; the expr is evaluated. If true, the same is repeated and when it becomes false the loop terminates.

Also See: Statements, While

**for**

*For* is also used as a loop/iteration statement.
The syntax is:

```
for (expr1;expr2;expr3)
    statement
```

The expressions are loop control statements. *expr1* is the initialization, *expr2* is the termination check and *expr3* is re-initialization. Any of them can be omitted.

Example:
```
for (i=1;i<=10;++i)
    printf("%u\r\n",i);
```

Also See: Statements
**switch**

*Switch* is also a special multi-way decision maker. The syntax is

```c
switch (expr) {
    case const1: stmt sequence;
    break;
    ...
    [default: stmt]
}
```

This tests whether the expression matches one of the constant values and branches accordingly. If none of the cases are satisfied the default case is executed. The break causes an immediate exit, otherwise control falls through to the next case.

Example:

```c
switch (cmd) {
    case 0: printf("cmd 0");
    break;
    case 1: printf("cmd 1");
    break;
    default: printf("bad cmd");
    break; }
```

Also See: [Statements](#)

---

**return**

*return* statement allows an immediate exit from a switch or a loop or function and also returns a value.

The syntax is:

```c
return (expr);
```

Example:

```c
return (5);
```

Also See: [Statements](#)
goto

The goto statement cause an unconditional branch to the label.

The syntax is:

```c
goto label;
```

A label has the same form as a variable name, and is followed by a colon. The goto's are used sparingly, if at all.

Example:

```c
goto loop;
```

Also See: Statements

label

The label a goto jumps to.

The syntax is:

```c
label: stmt;
```

Example:

```c
loop: i++;
```

Also See: Statements

break

The break statement is used to exit out of a control loop. It provides an early exit from while, for, do and switch.

The syntax is

```c
break;
```

It causes the innermost enclosing loop (or switch) to be exited immediately.
Example:
break;

Also See: Statements

**continue**

The **continue** statement causes the next iteration of the enclosing loop (While, For, Do) to begin.
The syntax is:

```
continue;
```

It causes the test part to be executed immediately in case of do and while and the control passes the re-initialization step in case of for.

Example:
```
continue;
```

Also See: Statements

**expr**

The syntax is:
```
expr;
```

Example:
```
i=1;
```

Also See: Statements

;

Statement: ;
Example:
;
Also See: Statements

**stmt**

Zero or more semi-colon separated. The syntax is:

```latex
{{stmt!}}
```

Example:
```latex
{a=1;
b=1; }
```

Also See: Statements

(Operators on the same line are equal in precedence)
Data Definitions

This section describes what the basic data types and specifiers are and how variables can be declared using those types. In C all the variables should be declared before they are used. They can be defined inside a function (local) or outside all functions (global). This will affect the visibility and life of the variables.

A declaration consists of a type qualifier and a type specifier, and is followed by a list of one or more variables of that type.
For example:

```c
int a,b,c,d;
mybit e,f;
mybyte g[3][2];
char *h;
colors j;
struct data_record data[10];
static int i;
extern long j;
```

Variables can also be declared along with the definitions of the special types.
For example:

```c
enum colors{red, green=2,blue}i,j,k;  // colors is the enum type and i,j,k
//are variables of that type
```

## Type Specifiers

### Basic Types

<table>
<thead>
<tr>
<th>Type-Specifier</th>
<th>Size</th>
<th>Unsigned</th>
<th>Signed</th>
<th>Digits</th>
</tr>
</thead>
<tbody>
<tr>
<td>int1</td>
<td>1 bit number</td>
<td>0 to 1</td>
<td>N/A</td>
<td>1/2</td>
</tr>
<tr>
<td>int8</td>
<td>8 bit number</td>
<td>0 to 255</td>
<td>-128 to 127</td>
<td>2-3</td>
</tr>
<tr>
<td>int16</td>
<td>16 bit number</td>
<td>0 to 65535</td>
<td>-32768 to 32767</td>
<td>4-5</td>
</tr>
<tr>
<td>int32</td>
<td>32 bit number</td>
<td>0 to 4294967295</td>
<td>-2147483648 to 2147483647</td>
<td>9-10</td>
</tr>
<tr>
<td>float32</td>
<td>32 bit float</td>
<td>-1.5 x 10^{45} to 3.4 x 10^{38}</td>
<td>7-8</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>C Standard Type</th>
<th>Default Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>int1</td>
</tr>
<tr>
<td>char</td>
<td>unsigned int8</td>
</tr>
<tr>
<td>int</td>
<td>int8</td>
</tr>
<tr>
<td>long</td>
<td>int16</td>
</tr>
<tr>
<td>long long</td>
<td>int32</td>
</tr>
<tr>
<td>float</td>
<td>float32</td>
</tr>
<tr>
<td>double</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Note: All types, except float char, by default are un-signed; however, may be preceded by unsigned or signed (Except int64 may only be signed). Short and long may have the keyword INT following them with no effect. Also see #TYPE to change the default size.

SHORT INT1 is a special type used to generate very efficient code for bit operations and I/O. Arrays of bits (INT1 or SHORT) in RAM are now supported. Pointers to bits are not permitted. The device header files contain defines for BYTE as an int8 and BOOLEAN as an int1.

Integers are stored in little endian format. The LSB is in the lowest address. Float formats are described in common questions.

## Type Qualifiers

<table>
<thead>
<tr>
<th>Type-Qualifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>Variable is globally active and initialized to 0. Only accessible from this compilation unit.</td>
</tr>
<tr>
<td>auto</td>
<td>Variable exists only while the procedure is active. This is the default and AUTO need not be used.</td>
</tr>
<tr>
<td>double</td>
<td>Is a reserved word but is not a supported data type.</td>
</tr>
<tr>
<td>extern</td>
<td>External variable used with multiple compilation units. No storage is allocated. Is used to make otherwise out of scope data accessible. there must be a non-extern definition at the global level in some compilation unit.</td>
</tr>
<tr>
<td>register</td>
<td>Is allowed as a qualifier however, has no effect.</td>
</tr>
<tr>
<td>_fixed(n)</td>
<td>Creates a fixed point decimal number where ( n ) is how many decimal places to implement.</td>
</tr>
<tr>
<td>unsigned</td>
<td>Data is always positive. This is the default data type if not specified.</td>
</tr>
<tr>
<td>signed</td>
<td>Data can be negative or positive.</td>
</tr>
<tr>
<td>volatile</td>
<td>Tells the compiler optimizer that this variable can be changed at any point during execution.</td>
</tr>
<tr>
<td>const</td>
<td>Data is read-only. Depending on compiler configuration, this qualifier may just make the data read-only -AND/OR- it may place the data into program memory to save space. (see #DEVICE const=)</td>
</tr>
<tr>
<td>rom</td>
<td>Forces data into program memory. Pointers may be used to this data but they can not be mixed with RAM pointers.</td>
</tr>
<tr>
<td>void</td>
<td>Built-in basic type. Type void is used to indicate no specific type in places where a type is required.</td>
</tr>
<tr>
<td>readonly</td>
<td>Writes to this variable should be dis-allowed</td>
</tr>
<tr>
<td>_bif</td>
<td>Used for compiler built in function prototypes on the same line</td>
</tr>
<tr>
<td><strong>attribute</strong></td>
<td>Sets various attributes</td>
</tr>
</tbody>
</table>
**Enumerated Types**

`enum` enumeration type: creates a list of integer constants.

```
enum [id] { [ id [ = cexpr]] }
```

The id after `enum` is created as a type large enough to the largest constant in the list. The ids in the list are each created as a constant. By default the first id is set to zero and they increment by one. If `a = cexpr` follows an id that id will have the value of the constant expression and the following list will increment by one.

For example:
```
enum colors{red, green=2, blue};  // red will be 0,
green will be 2 and             // blue will be 3
```

**Structures and Unions**

`struct` structure type: creates a collection of one or more variables, possibly of different types, grouped together as a single unit.

```
struct[*] [id] type-qualifier [*] id [ :bits]; } [id]
```

For example:
```
struct data_record {
    int a[2];
    int b : 2; /*2 bits */
    int c : 3; /*3 bits*/
    int d;
```
Union type: holds objects of different types and sizes, with the compiler keeping track of size and alignment requirements. They provide a way to manipulate different kinds of data in a single area of storage.

<table>
<thead>
<tr>
<th>union[*] [id] {</th>
<th>type-qualifier [*] id [:bits];</th>
<th>} [id]</th>
</tr>
</thead>
<tbody>
<tr>
<td>One or more, semi-colon separated</td>
<td>Zero or more</td>
<td></td>
</tr>
</tbody>
</table>

For example:
union u_tab {
    int ival;
    long lval;
    float fval;
}; // u_tag is a union type that can hold a float

typedef

If typedef is used with any of the basic or special types it creates a new type name that can be used in declarations. The identifier does not allocate space but rather may be used as a type specifier in other data definitions.

typedef

For example:
typedef int mybyte; // mybyte can be used in // declaration to
type
typedef short mybit; // mybyte can be used in // declaration to
CCS C Compiler

```c
// specify the int
type
typedef enum {red, green=2,blue}colors; //colors can be used to declare
enum type
```

Non-RAM Data Definitions

CCS C compiler also provides a custom qualifier `addressmod` which can be used to define a memory region that can be RAM, program eeprom, data eeprom or external memory. `Addressmod` replaces the older `typemod` (with a different syntax).

The usage is:

```c
addressmod
(name,read_function,write_function,start_address,end_address, share);
```

Where the `read_function` and `write_function` should be blank for RAM, or for other memory should be the following prototype:

```c
// read procedure for reading n bytes from the memory starting at location addr
void read_function(int32 addr, int8 *ram, int nbytes)

//write procedure for writing n bytes to the memory starting at location addr
void write_function(int32 addr, int8 *ram, int nbytes)
```

For RAM the share argument may be true if unused RAM in this area can be used by the compiler for standard variables.

Example:

```c
void DataEE_Read(int32 addr, int8 * ram, int bytes) {
    int i;
    for(i=0;i<bytes;i++,ram++,addr++)
        *ram=read_eeprom(addr);
```
void DataEE_Write(int32 addr, int8 * ram, int bytes) {
    int i;
    for(i=0; i<bytes; i++, ram++, addr++)
        write_eeprom(addr, *ram);
}

addressmod (DataEE, DataEE_read, DataEE_write, 5, 0xff);

    // would define a region called DataEE
    // between
    // 0x5 and 0xff in the chip data EEPROM.

void main (void)
{
    int DataEE test;
    int x, y;
    x=12;
    test=x;  // writes x to the Data EEPROM
    y=test;  // Reads the Data EEPROM
}

Note: If the area is defined in RAM then read and write functions are not required, the variables assigned in the memory region defined by the addressmod can be treated as a regular variable in all valid expressions. Any structure or data type can be used with an addressmod. Pointers can also be made to an addressmod data type. The #type directive can be used to make this memory region as default for variable allocations.

The syntax is:
#type default=addressmodname  // all the
variable declarations that
will use this memory region  // follow
#type default=  // goes back
to the default mode

For example:
Type default=emi            //emi is the
addressmod name defined
char buffer[8192];
#include <memoryhog.h>
#type default=
CCS C Compiler

Using Program Memory for Data

CCS C Compiler provides a few different ways to use program memory for data. The different ways are discussed below:

Constant Data:
The const qualifier will place the variables into program memory. If the keyword const is used before the identifier, the identifier is treated as a constant. Constants should be initialized and may not be changed at run-time. This is an easy way to create lookup tables.

The rom Qualifier puts data in program memory with 3 bytes per instruction space. The address used for ROM data is not a physical address but rather a true byte address. The & operator can be used on ROM variables however the address is logical not physical.

The syntax is:
\[ \text{const type id[cexp]} = \{\text{value}\} \]

For example:

Placing data into ROM
\[ \text{const int table[16]} = \{0,1,2...15\} \]

Placing a string into ROM
\[ \text{const char cstring[6]} = \{"hello"\} \]

Creating pointers to constants
\[ \text{const char *cptr;} \]
\[ \text{cptr = string;} \]

The #org preprocessor can be used to place the constant to specified address blocks.
For example:
The constant ID will be at 1C00.
\[ \text{#ORG 0x1C00, 0x1C0F} \]
\[ \text{CONST CHAR ID[10]} = \{"123456789"\}; \]

Note: Some extra code will precede the 123456789.

The function label_address can be used to get the address of the constant. The constant variable can be accessed in the code. This is a great way of storing constant data in large programs. Variable length constant strings can be stored into program memory.

A special method allows the use of pointers to ROM. This method does not contain extra code at the start of the structure as does constant.
For example:
\[ \text{char rom commands[]} = \{"\text{put|get|status|shutdown}"\}; \]

The compiler allows a non-standard C feature to implement a constant array of variable length strings.
The syntax is:
\[ \text{const char id[n] [\*]} = \{\text{"string", "string" ...}\}; \]

Where n is optional and id is the table identifier.
Data Definitions

For example:
```
const char colors[] [*] = {"Red", "Green", "Blue"};
```

#ROM directive:
Another method is to use #rom to assign data to program memory.
The syntax is:
```
#rom address = {data, data, ... , data}
```
For example:
```
Places 1,2,3,4 to ROM addresses starting at 0x1000
#rom 0x1000 = {1, 2, 3, 4}
Places null terminated string in ROM
#rom 0x1000="hello"
```
This method can only be used to initialize the program memory.

Built-in-Functions:
The compiler also provides built-in functions to place data in program memory, they are:
- `write_program_eeprom(address, data);`
  - Writes data to program memory
- `write_program_memory(address, dataptr, count);`
  - Writes count bytes of data from dataptr to address in program memory.
Please refer to the help of these functions to get more details on their usage and limitations regarding erase procedures. These functions can be used only on chips that allow writes to program memory. The compiler uses the flash memory erase and write routines to implement the functionality.

The data placed in program memory using the methods listed above can be read from with the following functions:
- `read_program_memory((address, dataptr, count)`
  - Reads count bytes from program memory at address to RAM at dataptr.

These functions can be used only on chips that allow reads from program memory. The compiler uses the flash memory read routines to implement the functionality.

Named Registers

The CCS C Compiler supports the new syntax for filing a variable at the location of a processor register. This syntax is being proposed as a C extension for embedded use. The same functionality is provided with the non-standard `#byte, #word, #bit` and `#locate`.

The syntax is:
```
register _name type id;
```
```
Or
```
register constant type id;
```
name is a valid SFR name with an underscore before it.

Examples:

```c
register _status int8 status_reg;
register _T1IF int8 timer_interrupt;
register 0x04 int16 file_select_register;
```
Function Definition

The format of a function definition is as follows:

```
[qualifier] id ( [type-specifier id] ) { [stmt] }
```

<table>
<thead>
<tr>
<th>Optional See Below</th>
<th>Zero or more comma separated. See Data Types</th>
<th>Zero or more Semi-colon separated. See Statements</th>
</tr>
</thead>
</table>

The qualifiers for a function are as follows:
- VOID
- type-specifier
- #separate
- #inline
- #int...

When one of the above are used and the function has a prototype (forward declaration of the function before it is defined) you must include the qualifier on both the prototype and function definition.

A (non-standard) feature has been added to the compiler to help get around the problems created by the fact that pointers cannot be created to constant strings. A function that has one CHAR parameter will accept a constant string where it is called. The compiler will generate a loop that will call the function once for each character in the string.

Example:

```c
void lcd_putchar(char c) {
    ...
}
```

```c
lcd_putchar("Hi There.");
```
Overloaded Functions

Overloaded functions allow the user to have multiple functions with the same name, but they must accept different parameters.

Here is an example of function overloading: Two functions have the same name but differ in the types of parameters. The compiler determines which data type is being passed as a parameter and calls the proper function.

This function finds the square root of a long integer variable.

```c
long FindSquareRoot(long n){
}
```

This function finds the square root of a float variable.

```c
float FindSquareRoot(float n){
}
```

FindSquareRoot is now called. If variable is of long type, it will call the first FindSquareRoot() example. If variable is of float type, it will call the second FindSquareRoot() example.

```c
result=FindSquareRoot(variable);
```

Reference Parameters

The compiler has limited support for reference parameters. This increases the readability of code and the efficiency of some inline procedures. The following two procedures are the same. The one with reference parameters will be implemented with greater efficiency when it is inline.

```c
funct_a(int*x, int*y){
    /*Traditional*/
    if(*x!=5)
        *y=*x+3;
}
funct_a(&a,&b);
```

```c
funct_b(int&x, int&y){
    /*Reference params*/
    if(x!=5)
```
Default Parameters

Default parameters allows a function to have default values if nothing is passed to it when called.

```c
int mygetc(char *c, int n=100)
```

This function waits n milliseconds for a character over RS232. If a character is received, it saves it to the pointer c and returns TRUE. If there was a timeout it returns FALSE.

```c
//gets a char, waits 100ms for timeout
mygetc(&c);
//gets a char, waits 200ms for a timeout
mygetc(&c, 200);
```

Variable Argument Lists

The compiler supports a variable number of parameters. This works like the ANSI requirements except that it does not require at least one fixed parameter as ANSI does. The function can be passed any number of variables and any data types. The access functions are VA_START, VA_ARG, and VA_END. To view the number of arguments passed, the NARGS function can be used.

```c
#include <stdarg.h>
```

A function with variable number of parameters requires two things. First, it requires the ellipsis (...), which must be the last parameter of the function. The ellipsis represents the variable argument list. Second, it requires one more variable before the ellipsis (...).

Here is a function that calculates and returns the sum of all variables:
int Sum(int count, ...) 
{
    // a pointer to the argument list
    va_list al;
    int x, sum=0;
    // start the argument list
    // count is the first variable before the ellipsis
    va_start(al, count);
    while(count--) {
        // get an int from the list
        x = var_arg(al, int);
        sum += x;
    }
    // stop using the list
    va_end(al);
    return(sum);
}

Some examples of using this new function:
    x=Sum(5, 10, 20, 30, 40, 50);
    y=Sum(3, a, b, c);
## FUNCTIONAL OVERVIEW

### I2C

I2C™ is a popular two-wire communication protocol developed by Phillips. Many PIC microcontrollers support hardware-based I2C™. CCS offers support for the hardware-based I2C™ and a software-based master I2C™ device. (For more information on the hardware-based I2C module, please consult the datasheet for your target device; not all PICs support I2C™.)

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>i2c_start()</td>
</tr>
<tr>
<td>i2c_write(data)</td>
</tr>
<tr>
<td>i2c_read()</td>
</tr>
<tr>
<td>i2c_stop()</td>
</tr>
<tr>
<td>i2c_poll()</td>
</tr>
</tbody>
</table>

### Relevant Preprocessor:

```
#define Device_SDA PIN_C3
// Pin defines
#define Device_SCL PIN_C4
```

### Relevant Preprocessor:

```
#define USE I2C
Configures the compiler to support I2C™ to your specifications.
```

### Relevant Interrupts:

```
#define INT_SSP I2C or SPI activity
#define INT_BUSCOL Bus Collision
#define INT_I2C I2C Interrupt (Only on 14000)
#define INT_BUSCOL2 Bus Collision (Only supported on some PIC18’s)
#define INT_SSP2 I2C or SPI activity (Only supported on some PIC18’s)
```

### Relevant Include Files:
None, all functions built-in

### Relevant getenv() Parameters:

```
I2C_SLAVE Returns a 1 if the device has I2C slave H/W
I2C_MASTER Returns a 1 if the device has a I2C master H/W
```

### Example Code:

```
#define Device_SDA PIN_C3
// Pin defines
#define Device_SCL PIN_C4
#use i2c(master, sda=Device_SDA, scl=Device_SCL) // Configure Device as Master
```
BYTE data; // Data to be transmitted
i2c_start(); // Issues a start command when in the I2C master mode.
i2c_write(data); // Sends a single byte over the I2C interface.
i2c_stop(); // Issues a stop command when in the I2C master mode.

ADC

These options let the user configure and use the analog to digital converter module. They are only available on devices with the ADC hardware. The options for the functions and directives vary depending on the chip and are listed in the device header file. On some devices there are two independent ADC modules, for these chips the second module is configured using secondary ADC setup functions (Ex. setup_ADC2).

Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_adc(mode)</td>
<td>Sets up the a/d mode like off, the adc clock etc.</td>
</tr>
<tr>
<td>setup_adc_ports(value)</td>
<td>Sets the available adc pins to be analog or digital.</td>
</tr>
<tr>
<td>set_adc_channel(channel)</td>
<td>Specifies the channel to be use for the a/d call.</td>
</tr>
<tr>
<td>read_adc(mode)</td>
<td>Starts the conversion and reads the value. The mode can also control the functionality.</td>
</tr>
<tr>
<td>adc_done()</td>
<td>Returns 1 if the ADC module has finished its conversion.</td>
</tr>
</tbody>
</table>

Relevant Preprocessor:

<table>
<thead>
<tr>
<th>Preprocessor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#DEVICE ADC=xx</td>
<td>Configures the read_adc return size. For example, using a PIC with a 10 bit A/D you can use 8 or 10 for xx- 8 will return the most significant byte, 10 will return the full A/D reading of 10 bits.</td>
</tr>
</tbody>
</table>

Relevant Interrupts:

<table>
<thead>
<tr>
<th>Interrupt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INT_AD</td>
<td>Interrupt fires when a/d conversion is complete</td>
</tr>
<tr>
<td>INT_ADOF</td>
<td>Interrupt fires when a/d conversion has timed out</td>
</tr>
</tbody>
</table>

Relevant Include Files:
None, all functions built-in

Relevant getenv() parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_CHANNELS</td>
<td>Number of A/D channels</td>
</tr>
<tr>
<td>ADC_RESOLUTION</td>
<td>Number of bits returned by read_adc</td>
</tr>
</tbody>
</table>
Example Code:

```c
#DEVICE ADC=10
...
long value;
...
setup_adc(ADC_CLOCK_INTERNAL);
    //enables the a/d module
    //and sets the clock to internal adc clock
setup_adc_ports(ALL_ANALOG);
    //sets all the adc pins to analog
set_adc_channel(0);
    //the next read_adc call will read channel 0
delay_us(10);
    //a small delay is required after setting the channel
    //and before read
value=read_adc();
    //starts the conversion and reads the result
    //and store it in value
read_adc(ADC_START_ONLY);
    //only starts the conversion
value=read_adc(ADC_READ_ONLY);
    //reads the result of the last conversion and store it in //value. Assuming the device hat a 10bit ADC module, //value will range between 0-3FF. If #DEVICE ADC=8 had //been used instead the result will yield 0-FF. If #DEVICE //ADC=16 had been used instead the result will yield 0-//FFC0
```

## Analog Comparator

These functions set up the analog comparator module. Only available in some devices.

### Relevant Functions:

**setup_comparator(mode)**

Enables and sets the analog comparator module. The options vary depending on the chip. Refer to the header file for details.

### Relevant Preprocessor:

None

### Relevant Interrupts:

**INT_COMP**

Interrupt fires on comparator detect. Some chips have more than one comparator unit, and thus, more interrupts.

### Relevant Include Files:

None, all functions built-in

### Relevant getenv() Parameters:

Returns 1 if the device has a comparator

COMP
Example Code:
```c
setup_comparator(A4_A5_NC_NC);
if(C1OUT)
  output_low(PIN_D0);
else
  output_high(PIN_D1);
```

## CAN Bus

These functions allow easy access to the Controller Area Network (CAN) features included with the MCP2515 CAN interface chip and the PIC18 MCU. These functions will only work with the MCP2515 CAN interface chip and PIC microcontroller units containing either a CAN or an ECAN module. Some functions are only available for the ECAN module and are specified by the work ECAN at the end of the description. The listed interrupts are no available to the MCP2515 interface chip.

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>can_init(void);</td>
<td>Initializes the CAN module and clears all the filters and masks so that all messages can be received from any ID.</td>
</tr>
<tr>
<td>can_set_baud(void);</td>
<td>Initializes the baud rate of the CAN bus to 125kHz, if using a 20 MHz clock and the default CAN-BRG defines, it is called inside the can_init() function so there is no need to call it.</td>
</tr>
<tr>
<td>can_set_mode (CAN_OP_MODE mode);</td>
<td>Allows the mode of the CAN module to be changed to configuration mode, listen mode, loop back mode, disabled mode, or normal mode.</td>
</tr>
<tr>
<td>can_set_functional_mode (CAN_FUN_OP_MODE mode);</td>
<td>Allows the functional mode of ECAN modules to be changed to legacy mode, enhanced legacy mode, or first in firstout (fifo) mode. ECAN</td>
</tr>
<tr>
<td>can_set_id(int* addr, int id, int1 ext);</td>
<td>Can be used to set the filter and mask ID's to the value specified by addr. It is also used to set the ID of the message to be sent.</td>
</tr>
<tr>
<td>can_get_id(int * addr, int1 ext);</td>
<td>Returns the ID of a received message.</td>
</tr>
<tr>
<td>can_putd (int32 id, int * data, int len, int priority, int1 ext, int1 rtr);</td>
<td>Constructs a CAN packet using the given arguments and places it in one of the available transmit buffers.</td>
</tr>
<tr>
<td>can_getd (int32 &amp; id, int * data, int &amp; len,</td>
<td>Retrieves a received message from one of the CAN buffers and stores the relevant data in the</td>
</tr>
</tbody>
</table>
**Functional Overview**

<table>
<thead>
<tr>
<th>Function Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>struct rx_stat &amp; stat);</code></td>
<td>referenced function parameters.</td>
</tr>
<tr>
<td><code>can_enable_rtr(PROG_BUFFER b);</code></td>
<td>Enables the automatic response feature which automatically sends a user created packet when a specified ID is received. ECAN</td>
</tr>
<tr>
<td><code>can_disable_rtr(PROG_BUFFER b);</code></td>
<td>Disables the automatic response feature. ECAN</td>
</tr>
<tr>
<td><code>can_load_rtr (PROG_BUFFER b, int * data, int len);</code></td>
<td>Creates and loads the packet that will automatically transmitted when the triggering ID is received. ECAN</td>
</tr>
<tr>
<td><code>can_enable_filter(long filter);</code></td>
<td>Enables one of the extra filters included in the ECAN module. ECAN</td>
</tr>
<tr>
<td><code>can_disable_filter(long filter);</code></td>
<td>Disables one of the extra filters included in the ECAN module. ECAN</td>
</tr>
<tr>
<td><code>can_associate_filter_to_buffer (CAN_FILTER_ASSOCIATION_BUFFERS buffer,CAN_FILTER_ASSOCIATION filter);</code></td>
<td>Used to associate a filter to a specific buffer. This allows only specific buffers to be filtered and is available in the ECAN module. ECAN</td>
</tr>
<tr>
<td><code>can_associate_filter_to_mask (CAN_MASK_FILTER_ASSOCIATE mask, CAN_FILTER_ASSOCIATION filter);</code></td>
<td>Used to associate a mask to a specific buffer. This allows only specific buffer to have this mask applied. This feature is available in the ECAN module. ECAN</td>
</tr>
<tr>
<td><code>can_fifo_getd(int32 &amp; id,int * data, int &amp;len,struct rx_stat &amp; stat);</code></td>
<td>Retrieves the next buffer in the fifo buffer. Only available in the ECON module while operating in fifo mode. ECAN</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:** None

**Relevant Interrupts:**

- **#int_canirx**
  - This interrupt is triggered when an invalid packet is received on the CAN.

- **#int_canwake**
  - This interrupt is triggered when the PIC is woken up by activity on the CAN.

- **#int_canerr**
  - This interrupt is triggered when there is an error in the CAN module.

- **#int_cantx0**
  - This interrupt is triggered when transmission from buffer 0 has completed.

- **#int_cantx1**
  - This interrupt is triggered when transmission from buffer 1 has completed.

- **#int_cantx2**
  - This interrupt is triggered when transmission from buffer 2 has completed.

- **#int_canrx0**
  - This interrupt is triggered when a message is
#int_canrx1

This interrupt is triggered when a message is received in buffer 1.

Relevant Include Files:

can-mcp2510.c

Drivers for the MCP2510 and MCP2515 interface chips

can-18xxx8.c

Drivers for the built in CAN module

can-18F4580.c

Drivers for the build in ECAN module

Relevant getenv() Parameters:

Example Code:

can_init(); // initializes the CAN bus

can_putd(0x300,data,8,TRUE,FALSE);

// places a message on the CAN buss with

// ID = 0x300 and eight bytes of data pointed to by

// "data", the TRUE creates an extended ID, the

// FALSE creates

can_getd(ID,data,len,stat);

// retrieves a message from the CAN bus storing the

// ID in the ID variable, the data at the array pointed
to by

// "data", the number of data bytes in len, and

// statistics

// about the data in the stat structure.

## CCP

These options lets to configure and use the CCP module. There might be multiple CCP modules for a device. These functions are only available on devices with CCP hardware. They operate in 3 modes: capture, compare and PWM. The source in capture/compare mode can be timer1 or timer3 and in PWM can be timer2 or timer4. The options available are different for different devices and are listed in the device header file. In capture mode the value of the timer is copied to the CCP_X register when the input pin event occurs. In compare mode it will trigger an action when timer and CCP_x values are equal and in PWM mode it will generate a square wave.

Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_ccp1(mode)</td>
<td>Sets the mode to capture, compare or PWM. For capture</td>
</tr>
<tr>
<td>set_pwm1_duty(value)</td>
<td>The value is written to the pwm1 to set the duty.</td>
</tr>
</tbody>
</table>

Relevant Preprocessor:

None

Relevant Interrupts:

INT_CCP1

Interrupt fires when capture or compare on CCP1
### Functional Overview

<table>
<thead>
<tr>
<th>Relevant Include Files:</th>
<th>None, all functions built-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relevant getenv() parameters:</td>
<td>CCP1 Returns 1 if the device has CCP1</td>
</tr>
</tbody>
</table>

#### CCP1

**Example Code:**

```c
#int_ccp1
void isr()
{
    rise = CCP_1; // CCP_1 is the time the pulse went high
    fall = CCP_2; // CCP_2 is the time the pulse went low
    pulse_width = fall - rise; // pulse width
}
```

```c
..
setup_ccp1(CCP_CAPTURE_RE); // Configure CCP1 to capture rise
setup_ccp2(CCP_CAPTURE_FE); // Configure CCP2 to capture fall
setup_timer_1(T1_INTERNAL); // Start timer 1
```

Some chips also have fuses which allows to multiplex the ccp/pwm on different pins. So check the fuses to see which pin is set by default. Also fuses to enable/disable pwm outputs.

### Code Profile

Profile a program while it is running. Unlike in-circuit debugging, this tool grabs information while the program is running and provides statistics, logging and tracing of it's execution. This is accomplished by using a simple communication method between the processor and the ICD with minimal side-effects to the timing and execution of the program. Another benefit of code profile versus in-circuit debugging is that a program written with profile support enabled will run correctly even if there is no ICD connected.

In order to use Code Profiling, several functions and pre-processor statements need to be included in the project being compiled and profiled. Doing this adds the proper code profile run-time support on the microcontroller.

See the help file in the Code Profile tool for more help and usage examples.

#### Relevant Functions:

| profileout() | Send a user specified message or variable to be displayed or logged by the code profile tool. |

#### Relevant Pre-Processor:

| #use profile() | Global configuration of the code profile run-time on the microcontroller. |
#profile
Dynamically enable/disable specific elements of the profiler.

**Relevant Interrupts:**
The profiler can be configured to use a microcontroller’s internal timer for more accurate timing of events over the clock on the PC. This timer is configured using the #profile pre-processor command.

**Relevant Include Files:**
None – all the functions are built into the compiler.

**Relevant getenv():**
None

**Example Code:**
```
#include <18F4520.h>
#define delay(crystal=10MHz, clock=40MHz)
#define profile functions, parameters
void main(void)
{
    int adc;
    setup_adc(ADC_CLOCK_INTERNAL);
    set_adc_channel(0);

    for(;;)
    {
        adc = read_adc();
        profileout(adc);
        delay_ms(250);
    }
}
```

**Configuration Memory**

On all PIC18 Family of chips, the configuration memory is readable and writable. This functionality is not available on the PIC16 Family of devices.

**Relevant Functions:**
- `write_configuration_memory(ramaddress, count)`
  - Writes count bytes, no erase needed
Functional Overview

**write_configuration_memory**

(Offset, ramaddress, count)

**read_configuration_memory**

(ramaddress, count)

or

Writes count bytes, no erase needed starting at byte address offset

Read count bytes of configuration memory

Relevant Preprocessor:
None

Relevant Include Files:
None, all functions built-in

Relevant getenv() parameters:
None

Example Code:
For PIC18f452
int16 data=0xc32;
...
**write_configuration_memory**(data,2);  //writes 2 bytes to the configuration memory

DAC

These options let the user configure and use the digital to analog converter module. They are only available on devices with the DAC hardware. The options for the functions and directives vary depending on the chip and are listed in the device header file.

**Relevant Functions:**

setup_dac(divisor)

Sets up the DAC e.g. Reference voltages

dac_write(value)

Writes the 8-bit value to the DAC module

Sets up the d/a mode e.g. Right enable, clock divisor

Writes the 16-bit value to the specified channel

**Relevant Preprocessor:**

#USE DELAY(clock=20M, Aux: crystal=6M, clock=3M)

**Relevant Interrupts:**
None

**Relevant Include Files:**
None, all functions built-in
Relevant getenv() parameters:

None

Example Code:

```c
int8 i=0;
setup_dac (DAC_VSS_VDD);
while (TRUE) {
  itt;
dac_write(i);
}
```

## Data Eeprom

The data eeprom memory is readable and writable in some chips. These options lets the user read and write to the data eeprom memory. These functions are only available in flash chips.

### Relevant Functions:

<table>
<thead>
<tr>
<th>8 bit or 16 bit depending on the device</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>read_eeprom(address)</strong></td>
</tr>
<tr>
<td><strong>write_eeprom(address, value)</strong></td>
</tr>
</tbody>
</table>

<tr>
<th>#ROM address={list}</th>
<th>Can also be used to put data EEPROM memory data into the hex file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>write_eeprom = noint</td>
<td>Allows interrupts to occur while the write_eeprom() operations is polling the done bit to check if the write operations has completed. Can be used as long as no EEPROM operations are performed during an ISR.</td>
</tr>
</tbody>
</table>

### Relevant Interrupts:

<table>
<thead>
<tr>
<th>INT_EEPROM</th>
<th>Interrupt fires when EEPROM write is complete</th>
</tr>
</thead>
</table>

### Relevant Include Files:

None, all functions built-in
### DATA_EEPROM

Size of data EEPROM memory.

**Example Code:**

For 18F452

```c
#define 0xf0000={1,2,3,4,5}  //inserts this data into the hex file. The data eeprom address
//differs for different family of chips. Please refer to the
//programming specs to find the right value for the device.
```

```c
write_eeprom(0x0,0x12);  //writes 0x12 to data eeprom location 0
value=read_eeprom(0x0);  //reads data eeprom location 0x0 returns 0x12
```

```c
#define 0x007FFC00={1,2,3,4,5}  // Inserts this data into the hex file
// The data EEPROM address differs between PICs
// Please refer to the device editor for device specific values.
```

```c
write_eeprom(0x10,0x1337);  // Writes 0x1337 to data EEPROM location 10.
value=read_eeprom(0x0);  // Reads data EEPROM location 10 returns 0x1337.
```

---

### Data Signal Modulator

The Data Signal Modulator (DSM) allows the user to mix a digital data stream (the “modulator signal”) with a carrier signal to produce a modulated output. Both the carrier and the modulator signals are supplied to the DSM module, either internally from the output of a peripheral, or externally through an input pin. The modulated output signal is generated by performing a logical AND operation of both the carrier and modulator signals and then it is provided to the MDOUT pin. Using this method, the DSM can generate the following types of key modulation schemes:

- Frequency Shift Keying (FSK)
- Phase Shift Keying (PSK)
- On-Off Keying (OOK)

**Relevant Functions:**

(8 bit or 16 bit depending on the device)

- `setup_dsm(mode,source,cARRIER)` Configures the DSM module and selects the source signal and carrier signals.
- `setup_dsm(TRUE)` Enables the DSM module.
<table>
<thead>
<tr>
<th>setup_dsm(FALSE)</th>

```

```c
if(input(PIN_B0))
setup_dsm(FALSE);
else
setup_dsm(TRUE);
```

---

**External Memory**

Some PIC18 devices have the external memory functionality where the external memory can be mapped to external memory devices like (Flash, EPROM or RAM). These functions are available only on devices that support external memory bus.

---

**General Purpose I/O**

These options let the user configure and use the I/O pins on the device. These functions will affect the pins that are listed in the device header file.

### Internal LCD

Some families of PIC microcontrollers can drive a glass segment LCD directly, without the need of an LCD controller. For example, the PIC16C92X, PIC16F91X, and PIC16F193X series of chips have an internal LCD driver module.

| Relevant getenv() Parameters: |
## Functional Overview

### LCD

Returns TRUE if the device has an Internal LCD Driver Module.

```c
// How each segment of the LCD is set (on or off) for the ASCII digits 0 to 9.
byte CONST DIGIT_MAP[10] = {0xFC, 0x60, 0xDA, 0xF2, 0x66, 0xB6, 0xBE, 0xE0, 0xFE, 0xE6};

// Define the segment information for the first digit of the LCD
#define DIGIT1 COM1+20, COM1+18,
            COM2+18, COM3+20, COM2+28, COM1+28,
            COM2+20, COM3+18

// Displays the digits 0 to 9 on the first digit of the LCD.

for(i = 0; i <= 9; i++) {
    lcd_symbol( DIGIT_MAP[i], DIGIT1 );
    delay_ms( 1000 );
}
```

### Internal Oscillator

Many chips have internal oscillator. There are different ways to configure the internal oscillator. Some chips have a constant 4 Mhz factory calibrated internal oscillator. The value is stored in some location (mostly the highest program memory) and the compiler moves it to the oscal register on startup. The programmers save and restore this value but if this is lost they need to be programmed before the oscillator is functioning properly.

Some chips have factory calibrated internal oscillator that offers software selectable frequency range(from 31Kz to 8 Mhz) and they have a default value and can be switched to a higher/lower value in software. They are also software tunable. Some chips also provide the PLL option for the internal oscillator.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>setup_oscillator(mode, finetune)</th>
<th>Sets the value of the internal oscillator and also tunes it. The options vary depending on the chip and are listed in the device header files.</th>
</tr>
</thead>
</table>

**Relevant Preprocessor:**

None

**Relevant Interrupts:**

<table>
<thead>
<tr>
<th>INT_OSC_FAIL or INT_OSCF</th>
<th>Interrupt fires when the system oscillator fails and the processor switches to the internal oscillator.</th>
</tr>
</thead>
</table>

**Relevant Include Files:**

None, all functions built-in
Relevant getenv() parameters: None

Example Code: For PIC18F8722

```c
setup_oscillator(OSC_32MHZ); //sets the internal oscillator to 32MHz (PLL enabled)
```

If the internal oscillator fuse option are specified in the #fuses and a valid clock is specified in the #use delay(clock=xxx) directive the compiler automatically sets up the oscillator. The #use delay statements should be used to tell the compiler about the oscillator speed.

## Interrupts

The following functions allow for the control of the interrupt subsystem of the microcontroller. With these functions, interrupts can be enabled, disabled, and cleared. With the preprocessor directives, a default function can be called for any interrupt that does not have an associated ISR, and a global function can replace the compiler generated interrupt dispatcher.

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable_interrupts()</td>
<td>Disables the specified interrupt.</td>
</tr>
<tr>
<td>enable_interrupts()</td>
<td>Enables the specified interrupt.</td>
</tr>
<tr>
<td>ext_int_edge()</td>
<td>Enables the edge on which the edge interrupt should trigger. This can be either rising or falling edge.</td>
</tr>
<tr>
<td>clear_interrupt()</td>
<td>This function will clear the specified interrupt flag.</td>
</tr>
<tr>
<td></td>
<td>This can be used if a global isr is used, or to prevent an interrupt from being serviced.</td>
</tr>
<tr>
<td>interrupt_active()</td>
<td>This function checks the interrupt flag of specified interrupt and returns true if flag is set.</td>
</tr>
<tr>
<td>interrupt_enabled()</td>
<td>This function checks the interrupt enable flag of the specified interrupt and returns TRUE if set.</td>
</tr>
</tbody>
</table>

### Relevant Preprocessor:

<table>
<thead>
<tr>
<th>Preprocessor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#DEVICE HIGH_INTS=</td>
<td>This directive tells the compiler to generate code for high priority interrupts.</td>
</tr>
<tr>
<td>#INT XXX fast</td>
<td>This directive tells the compiler that the specified interrupt should be treated as a high priority interrupt.</td>
</tr>
</tbody>
</table>

### Relevant Interrupts:

<table>
<thead>
<tr>
<th>Preprocessor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#int_default</td>
<td>This directive specifies that the following function</td>
</tr>
</tbody>
</table>
should be called if an interrupt is triggered but no routine is associated with that interrupt.

### #int_global
This directive specifies that the following function should be called whenever an interrupt is triggered. This function will replace the compiler generated interrupt dispatcher.

### #int_xxx
This directive specifies that the following function should be called whenever the xxx interrupt is triggered. If the compiler generated interrupt dispatcher is used, the compiler will take care of clearing the interrupt flag bits.

**Relevant Include Files:**
none, all functions built in.

**Relevant getenv() Parameters:**
none

**Example Code:**
```
#int_timer0

void timer0interrupt() // #int_timer associates the following function with the
// interrupt service routine that should be called
enable_interrupts(TIMER0); // enables the timer0 interrupt
disable_interrupts(TIMER0); // disables the timer0 interrupt
clear_interrupt(TIMER0); // clears the timer0 interrupt flag
```

---

**Low Voltage Detect**

These functions configure the high/low voltage detect module. Functions available on the chips that have the low voltage detect hardware.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_low_volt_detect(mode)</td>
<td>Sets the voltage trigger levels and also the mode (below or above in case of the high/low voltage detect module). The options vary depending on the chip and are listed in the device header files.</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**
None

**Relevant Interrupts :**
**INT_LOWVOLT**

Interrupt fires on low voltage detect

**Relevant Include Files:**
None, all functions built-in

**Relevant getenv() parameters:**
None

**Example Code:**

For PIC18F8722

```c
setup_low_volt_detect(LVD_36|LVD_TRIGGER_ABOVE);
// sets the trigger level as 3.6 volts and
```

trigger direction as above. The interrupt

```
// if enabled is fired
```

when the voltage is

```
// above 3.6 volts.
```

---

**PMP/EPMP**

The Parallel Master Port (PMP)/Enhanced Parallel Master Port (EPMP) is a parallel 8-bit/16-bit I/O module specifically designed to communicate with a wide variety of parallel devices. Key features of the PMP module are:

- 8 or 16 Data lines
- Up to 16 or 32 Programmable Address Lines
- Up to 2 Chip Select Lines
- Programmable Strobe option
- Address Auto-Increment/Auto-Decrement
- Programmable Address/Data Multiplexing
- Programmable Polarity on Control Signals
- Legacy Parallel Slave (PSP) Support
- Enhanced Parallel Slave Port Support
- Programmable Wait States

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_psp</td>
<td>This will setup the PMP/EPMP module for various mode and specifies which address lines to be used.</td>
</tr>
<tr>
<td>(options,address_mask)</td>
<td></td>
</tr>
<tr>
<td>setup_pmp_csx(options,[offset])</td>
<td>Sets up the Chip Select X Configuration, Mode and Base Address registers.</td>
</tr>
<tr>
<td>setup_psp_es(options)</td>
<td>Sets up the Chip Select X Configuration and Mode registers.</td>
</tr>
</tbody>
</table>
Write the data byte to the next buffer location.
This will write a byte of data to the next buffer location
or will write a byte to the specified buffer location.

Reads a byte of data.
psp_read() will read a byte of data from
the next buffer location and psp_read ( address )
will read the buffer location address.

Configures the address register of the PMP
module with the destination address.
This will return the status of the output
buffer underflow bit.

This will return the status of the input buffers.

This will return the status of the output buffers.

Relevant Preprocessor:
None

Relevant Interrupts:
#INT_PMP
Interrupt on read or write strobe

Relevant Include Files:
None, all functions built-in

Relevant getenv() parameters:
None

Example Code:
setup_pmp( PAR_ENABLE | PAR_MASTER_MODE_1 | PAR_STOP_IN_IDLE,0x0FF); // Sets up Master mode with
// address lines

PMA0:PMA7
psp_input_full();
psp_output_full();

if (pmp_output_full())
{
 pmp_write(next_byte);
}

---

Power PWM

These options let the user configure the Pulse
Width Modulation (PWM) pins. They are only available
on devices equipped with PWM. The options for these
functions vary depending on the chip and are listed
in the device header file.

Relevant Functions:
### setup_power_pwm(config)
Sets up the PWM clock, period, dead time etc.

### setup_power_pwm_pins(module x)
Configure the pins of the PWM to be in Complimentary, ON or OFF mode.

### set_power_pwmx_duty(duty)
Stores the value of the duty cycle in the PDCXL/H register. This duty cycle value is the time for which the PWM is in active state.

### set_power_pwm_override(pwm,override,value)
This function determines whether the OVDCONS or the PDC registers determine the PWM output.

<table>
<thead>
<tr>
<th>Relevant Preprocessor:</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relevant Interrupts:</td>
<td>#INT_PWMTB PWM Timebase Interrupt (Only available on PIC18XX31)</td>
</tr>
<tr>
<td>Parameters:</td>
<td>None</td>
</tr>
</tbody>
</table>

#### Example Code:
```c
... long duty_cycle, period;
... // Configures PWM pins to be ON,OFF // or in Complimentary mode.

setup_power_pwm_pins(PWM_COMPLEMENTARY, PWM_OFF, PWM_OFF, PWM_OFF, PWM_OFF);
// Sets up PWM clock, postscale and // period. Here period is used to set the // PWM Frequency as follows:
// Frequency=Fosc/(4* (period+1) // *postscale)

setup_power_pwm(PWM_CLOCK_DIV_4|PWM_FREE_RUN,1,0,period,0,1,0);
set_power_pwm0_duty(duty_cycle)); // Sets the duty cycle of the PWM 0,1 in // Complementary mode
```
Program Eeprom

The Flash program memory is readable and writable in some chips and is just readable in some. These options let the user read and write to the Flash program memory. These functions are only available in flash chips.

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read_program_eeprom(address)</td>
<td>Reads the program memory location (16 bit or 32 bit depending on the device).</td>
</tr>
<tr>
<td>write_program_eeprom(address, value)</td>
<td>Writes value to program memory location address.</td>
</tr>
<tr>
<td>erase_program_eeprom(address)</td>
<td>Erases FLASH_ERASE_SIZE bytes in program memory.</td>
</tr>
<tr>
<td>write_program_memory(address, dataptr, count)</td>
<td>Writes count bytes to program memory from dataptr to address. When address is a multiple of FLASH_ERASE_SIZE an erase is also performed.</td>
</tr>
<tr>
<td>read_program_memory(address, dataptr, count)</td>
<td>Read count bytes from program memory at address to dataptr.</td>
</tr>
</tbody>
</table>

### Relevant Preprocessor:

- **#ROM address={list}**: Can be used to put program memory data into the hex file.
- **#DEVICE(WRITE_EEPROM=ASYNC)**: Can be used with #DEVICE to prevent the write function from hanging. When this is used make sure the eeprom is not written both inside and outside the ISR.

### Relevant Interrupts:

- **INT_EEPROM**: Interrupt fires when eeprom write is complete.

### Relevant Include Files:

None, all functions built-in

### Relevant getenv() parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROGRAM_MEMORY</td>
<td>Size of program memory</td>
</tr>
<tr>
<td>READ_PROGRAM</td>
<td>Returns 1 if program memory can be read</td>
</tr>
<tr>
<td>FLASH_WRITE_SIZE</td>
<td>Smallest number of bytes written in flash</td>
</tr>
<tr>
<td>FLASH_ERASE_SIZE</td>
<td>Smallest number of bytes erased in flash</td>
</tr>
</tbody>
</table>

### Example Code:

For 18F452 where the write size is 8 bytes and erase size is 64 bytes

```
#rom 0xa00={1,2,3,4,5}  //inserts this data into the hex file.
erase_program_eeprom(0x1)  //erases 64 bytes string at 0x1000
```
```c
000);
write_program_eeprom(0x1000,0x1234);  //writes 0x1234 to 0x1000
value=read_program_eeprom(0x1000);  //reads 0x1000 returns 0x1234
write_program_memory(0x1000,data,8);  //erases 64 bytes starting at 0x1000 as 0x1000 is a multiple
//of 64 and writes 8 bytes from data to 0x1000
read_program_memory(0x1000,value,8);  //reads 8 bytes to value from 0x1000
erase_program_eeprom(0x1000);  //erases 64 bytes starting at 0x1000
write_program_memory(0x1000,data,8);  //writes 8 bytes from data to 0x1000
read_program_memory(0x1000,value,8);  //reads 8 bytes to value from 0x1000
```

For chips where `getenv("FLASH_ERASE_SIZE") > getenv("FLASH_WRITE_SIZE")`

<table>
<thead>
<tr>
<th>WRITE_PROGRAM_EEPROM -</th>
<th>Writes 2 bytes, does not erase (use ERASE_PROGRAM_EEPROM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRITE_PROGRAM_MEMORY -</td>
<td>Writes any number of bytes, will erase a block whenever the first (lowest) byte in a block is written to. If the first address is not the start of a block that block is not erased.</td>
</tr>
<tr>
<td>ERASE_PROGRAM_EEPROM -</td>
<td>Will erase a block. The lowest address bits are not used.</td>
</tr>
</tbody>
</table>

For chips where `getenv("FLASH_ERASE_SIZE") = getenv("FLASH_WRITE_SIZE")`

| WRITE_PROGRAM_EEPROM - | Writes 2 bytes, no erase is needed. |
| WRITE_PROGRAM_MEMORY - | Writes any number of bytes, bytes outside the range of the write block are not changed. No erase is needed. |
| ERASE_PROGRAM_EEPROM - | Not available. |

## PSP

These options let to configure and use the Parallel Slave Port on the supported devices.

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>setup_psp(mode)</code></td>
<td>Enables/disables the psp port on the chip</td>
</tr>
<tr>
<td><code>psp_output_full()</code></td>
<td>Returns 1 if the output buffer is full (waiting to be read by the external bus)</td>
</tr>
<tr>
<td><code>psp_input_full()</code></td>
<td>Returns 1 if the input buffer is full (waiting to read by the cpu)</td>
</tr>
</tbody>
</table>
### psp_overflow()

Returns 1 if a write occurred before the previously written byte was read.

**Relevant Preprocessor:** None  
**Relevant Interrupts:** INT_PSP  
**Relevant Include Files:** None, all functions built-in  
**Relevant getenv() parameters:** PSP

**Example Code:**

```c
while(psp_output_full());  // waits till the output buffer is cleared  
psp_data=command;  // writes to the port  
while(!input_buffer_full());  // waits till input buffer is cleared  
if (psp_overflow())
    error=true  // if there is an overflow set the error flag  
else
    data=psp_data;  // if there is no overflow then read the port
```

---

### QEI

The Quadrature Encoder Interface (QEI) module provides the interface to incremental encoders for obtaining mechanical positional data.

**Relevant Functions:**

- **setup_qei(options, filter,maxcount)**: Configures the QEI module.  
- **qei_status()**: Returns the status of the QEI module.  
- **qei_set_count(value)**: Write a 16-bit value to the position counter.  
- **qei_get_count()**: Reads the current 16-bit value of the position counter.

**Relevant Preprocessor:** None  
**Relevant Interrupts:** #INT_QEI - Interrupt on rollover or underflow of the position counter
Relevant Include Files: None, all functions built-in

Relevant `getenv()` parameters: None

Example Code:
```c
int16 value;
setup_qei(QEI_MODE_X2|  //Setup the
    QEI_TIMER_INTERNAL,
    QEI_FILTER_DIV_2,QEI_FORWARD);

Value=qei_get_count();   //Read the count
```

---

**RS232 I/O**

These functions and directives can be used for setting up and using RS232 I/O functionality.

### Relevant Functions:

- **`getc()` or `getch()` or `getchar()` or `fgetc()`**
  Gets a character on the receive pin (from the specified stream in case of `fgetc`, stdin by default). Use `KBHIT` to check if the character is available.

- **`gets()` or `fgets()`**
  Gets a string on the receive pin (from the specified stream in case of `fgets`, STDIN by default). Use `getc` to receive each character until return is encountered.

- **`putc()` or `putchar()` or `fputc()`**
  Puts a character over the transmit pin (on the specified stream in the case of `fputc`, stdout by default)

- **`puts()` or `fputs()`**
  Puts a string over the transmit pin (on the specified stream in the case of `fputc`, stdout by default). Uses `putc` to send each character.

- **`printf()` or `fprintf()`**
  Prints the formatted string (on the specified stream in the case of `fprintf`, stdout by default). Refer to the `printf` help for details on format string.

- **`kbhit()`**
  Return true when a character is received in the buffer in case of hardware RS232 or when the first bit is sent on the RCV pin in case of software RS232. Useful for polling without waiting in `getc`. 
### Functional Overview

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>setup_uart(baud,[stream])</code></td>
<td>Used to change the baud rate of the hardware UART at runtime. Specifying stream is optional. Refer to the help for more advanced options.</td>
</tr>
<tr>
<td><code>setup_uart_speed(baud,[stream])</code></td>
<td>Checks the condition and if false prints the file name and line to STDERR. Will not generate code if <code>#DEFINE NODBUG</code> is used.</td>
</tr>
<tr>
<td><code>assert(condition)</code></td>
<td>Prints the message and the last system error to STDERR.</td>
</tr>
<tr>
<td><code>perror(message)</code></td>
<td>When using transmit buffer, used to transmit data from buffer. See function description for more detail on when needed.</td>
</tr>
<tr>
<td><code>putc_send()</code> or <code>fputc_send()</code></td>
<td>When using receive buffer, returns the number of bytes in buffer that still need to be retrieved.</td>
</tr>
<tr>
<td><code>tx_buffer_bytes()</code></td>
<td>When using transmit buffer, returns the number of bytes in buffer that still need to be sent.</td>
</tr>
<tr>
<td><code>tx_buffer_full()</code></td>
<td>When using transmit buffer, returns TRUE if transmit buffer is full.</td>
</tr>
<tr>
<td><code>receive_buffer_full()</code></td>
<td>When using receive buffer, returns TRUE if receive buffer is full.</td>
</tr>
<tr>
<td><code>tx_buffer_available()</code></td>
<td>When using transmit buffer, returns number of characters that can be put into transmit buffer before it overflows. Configures the compiler to support RS232 to specifications.</td>
</tr>
</tbody>
</table>

**#useRS232**

**Relevant Interrupts:**

- **INT_RDA**: Interrupt fires when the receive data available
- **INT_TBE**: Interrupt fires when the transmit data empty

Some chips have more than one hardware UART, and hence more interrupts.

**Relevant Include Files:**

None, all functions built-in
Relevant getenv() parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UART</td>
<td>Returns the number of UARTs on this PIC</td>
</tr>
<tr>
<td>AUART</td>
<td>Returns true if this UART is an advanced UART</td>
</tr>
<tr>
<td>UART_RX</td>
<td>Returns the receive pin for the first UART on this PIC (see PIN_XX)</td>
</tr>
<tr>
<td>UART_TX</td>
<td>Returns the transmit pin for the first UART on this PIC</td>
</tr>
<tr>
<td>UART2_RX</td>
<td>Returns the receive pin for the second UART on this PIC</td>
</tr>
<tr>
<td>UART2_TX</td>
<td>TX – Returns the transmit pin for the second UART on this PIC</td>
</tr>
</tbody>
</table>

Example Code:

```c
/*configure and enable uart, use first hardware UART on PIC*/
#define rs232(uart1, baud=9600)

/* print a string*/
printf("enter a character");

/* get a character*/
if (kbhit()) { //check if a character has been received
    c=getc(); //read character from UART
}
```

RTOS

These functions control the operation of the CCS Real Time Operating System (RTOS). This operating system is cooperatively multitasking and allows for tasks to be scheduled to run at specified time intervals. Because the RTOS does not use interrupts, the user must be careful to make use of the rtos_yield() function in every task so that no one task is allowed to run forever.

Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtos_run()</td>
<td>Begins the operation of the RTOS. All task management tasks are implemented by this function.</td>
</tr>
<tr>
<td>rtos_terminate()</td>
<td>This function terminates the operation of the RTOS and returns operation to the original program. Works as a return from the rtos_run() function.</td>
</tr>
</tbody>
</table>
### Functional Overview

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtos_enable(task)</td>
<td>Enables one of the RTOS tasks. Once a task is enabled, the rtos_run() function will call the task when its time occurs. The parameter to this function is the name of task to be enabled.</td>
</tr>
<tr>
<td>rtos_disable(task)</td>
<td>Disables one of the RTOS tasks. Once a task is disabled, the rtos_run() function will not call this task until it is enabled using rtos_enable(). The parameter to this function is the name of the task to be disabled.</td>
</tr>
<tr>
<td>rtos_msg_poll()</td>
<td>Returns true if there is data in the task's message queue.</td>
</tr>
<tr>
<td>rtos_msg_read()</td>
<td>Returns the next byte of data contained in the task's message queue.</td>
</tr>
<tr>
<td>rtos_msg_send(task, byte)</td>
<td>Sends a byte of data to the specified task. The data is placed in the receiving task's message queue.</td>
</tr>
<tr>
<td>rtos_yield()</td>
<td>Called with in one of the RTOS tasks and returns control of the program to the rtos_run() function. All tasks should call this function when finished.</td>
</tr>
<tr>
<td>rtos_signal(sem)</td>
<td>Increments a semaphore which is used to broadcast the availability of a limited resource.</td>
</tr>
<tr>
<td>rtos_wait(sem)</td>
<td>Waits for the resource associated with the semaphore to become available and then decrements to semaphore to claim the resource.</td>
</tr>
<tr>
<td>rtos_await(expre)</td>
<td>Will wait for the given expression to evaluate to true before allowing the task to continue.</td>
</tr>
<tr>
<td>rtos_overrun(task)</td>
<td>Will return true if the given task over ran its allotted time.</td>
</tr>
<tr>
<td>rtos_stats(task, stat)</td>
<td>Returns the specified statistic about the specified task. The statistics include the minimum and maximum times for the task to run and the total time the task has spent running.</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**

- `#USE RTOS(options)` This directive is used to specify several different RTOS attributes including the timer to use, the minor cycle time and whether or not statistics should be enabled.
- `#TASK(options)` This directive tells the compiler that the following function is to be an RTOS task.
- `#TASK` specifies the rate at which the task should be called, the maximum time the task shall be allowed to run, and how
Relevant Interrupts:
none

Relevant Include Files:
one all functions are built in

Relevant getenv() Parameters:
one

Example Code:
#USE
RTOS(timer=0, minor_cycle=20ms) // RTOS will use timer zero, minor cycle will be 20ms
...
int sem;
...
#TASK(rate=1s, max=20ms, queue=5) // Task will run at a rate of once per second void task_name(); // with a maximum running time of 20ms and
// a 5 byte queue
rtos_run(); // begins the RTOS
rtos_terminate(); // ends the RTOS

rtos_enable(task_name); // enables the previously declared task.
rtos_disable(task_name); // disables the previously declared task
rtos_msg_send(task_name, 5); // places the value 5 in task_name's queue.
rtos_yield(); // yields control to the RTOS
rtos_signal(sem); // signals that the resource represented by sem is available.

For more information on the CCS RTOS please

SPI

SPI™ is a fluid standard for 3 or 4 wire, full duplex communications named by Motorola. Most PIC devices support most common SPI™ modes. CCS provides a support library for taking advantage of both hardware and software based SPI™ functionality. For software support, see #USE SPI.
Functional Overview

### Relevant Functions:

- **setup_spi(mode)**
- **setup_spi2(mode)**
- **setup_spi3 (mode)**
- **setup_spi4 (mode)**

Configure the hardware SPI to the specified mode. The mode configures setup_spi2(mode) thing such as master or slave mode, clock speed and clock/data trigger configuration.

**Note:** for devices with dual SPI interfaces a second function, setup_spi2(), is provided to configure the second interface.

- **spi_data_is_in()**
  - Returns TRUE if the SPI receive buffer has a byte of data.

- **spi_data_is_in2()**

- **spi_write(value)**
- **spi_write2(value)**
  - Transmits the value over the SPI interface. This will cause the data to be clocked out on the SDO pin.

- **spi_read(value)**
- **spi_read2(value)**
  - Performs an SPI transaction, where the value is clocked out on the SDO pin and data clocked in on the SDI pin is returned. If you just want to clock in data then you can use spi_read() without a parameter.

### Relevant Preprocessor:

- None

### Relevant Interrupts:

- **#int_ssp**
- **#int_ssp2**
  - Transaction (read or write) has completed on the indicated peripheral.

### Relevant getenv() Parameters:

- **SPI**
  - Returns TRUE if the device has an SPI peripheral

### Example Code:

```c
// configure the device to be a master, data transmitted on H-to-L clock transition
setup_spi(SPI_MASTER | SPI_H_TO_L | SPI_CLK_DIV_16);

spi_write(0x80); // write 0x80 to SPI device
value=spi_read(); // read a value from the SPI device
value=spi_read(0x80); // write 0x80 to SPI device the same time you are reading a value.
```

### Timer0

These options lets the user configure and use timer0. It is available on all devices and is always enabled. The clock/counter is 8-bit on pic16s and 8 or 16 bit on pic18s. It counts
up and also provides interrupt on overflow. The options available differ and are listed in the device header file.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>setup_timer_0(mode)</code></td>
<td>Sets the source, prescale etc for timer0</td>
</tr>
<tr>
<td><code>set_timer0(value)</code> or <code>set_rtcc(value)</code></td>
<td>Initializes the timer0 clock/counter. Value may be a 8 bit or 16 bit depending on the device.</td>
</tr>
<tr>
<td><code>value=get_timer0</code></td>
<td>Returns the value of the timer0 clock/counter</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**
None

**Relevant Interrupts:**
- `INT_TIMER0` or `INT_RTCC`
  - Interrupt fires when timer0 overflows

**Relevant Include Files:**
None, all functions built-in

**Relevant getenv() parameters:**
- `TIMER0`
  - Returns 1 if the device has timer0

**Example Code:**
For PIC18F452

```c
setup_timer_0(RTCC_INTERNAL | RTCC_DIV_2 | RTCC_8_BIT);
//sets the internal clock as source
//and prescale 2. At 20Mhz timer0
//will increment every 0.4us in this
//setup and overflows every
//102.4us
set_timer0(0);
//this sets timer0 register to 0
time=get_timer0();
//this will read the timer0 register
//value
```

---

**Timer1**

These options lets the user configure and use timer1. The clock/counter is 16-bit on pic16s and pic18s. It counts up and also provides interrupt on overflow. The options available differ and are listed in the device header file.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>setup_timer_1(mode)</code></td>
<td>Disables or sets the source and prescale for timer1</td>
</tr>
<tr>
<td><code>set_timer1(value)</code></td>
<td>Initializes the timer1 clock/counter</td>
</tr>
<tr>
<td><code>value=get_timer1</code></td>
<td>Returns the value of the timer1 clock/counter</td>
</tr>
</tbody>
</table>
**Functional Overview**

**Relevant Preprocessor:**
None

**Relevant Interrupts:**
INT_TIMER1  
Interrupt fires when timer1 overflows

**Relevant Include Files:**
None, all functions built-in

**Relevant getenv() parameters:**
TIMER1  
Returns 1 if the device has timer1

**Example Code:**
For PIC18F452

```cpp
setup_timer_1(T1_DISABLED);  
//disables timer1

or

setup_timer_1(T1_INTERNAL|T1_DIV_BY_8);  
//sets the internal clock as source

//and prescale as 8. At 20Mhz timer1 will increment
//every 1.6us in this setup and overflows every
//104.896ms

set_timer1(0);  
//this sets timer1 register to 0

time=get_timer1();  
//this will read the timer1 register value
```

## Timer2

These options lets the user configure and use timer2. The clock/counter is 8-bit on pic16s and pic18s. It counts up and also provides interrupt on overflow. The options available differ and are listed in the device header file.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_timer_2(mode,period,postscale)</td>
<td>Disables or sets the prescale, period and a postscale for timer2</td>
</tr>
<tr>
<td>set_timer2(value)</td>
<td>Initializes the timer2 clock/counter</td>
</tr>
<tr>
<td>value=get_timer2</td>
<td>Returns the value of the timer2 clock/counter</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**
None

**Relevant Interrupts:**
INT_TIMER2  
Interrupt fires when timer2 overflows
Relevant Include Files:
None, all functions built-in

Relevant getenv() parameters:
**TIMER2** Returns 1 if the device has timer2

Example Code:
For PIC18F452
```c
setup_timer_2(T2_DISABLED);  //disables timer2
or
setup_timer_2(T2_DIV_BY_4, 0xc0, 2);  //sets the prescale as 4, period as 0xc0 and
                                        //postscales as 2.
//At 20Mhz timer2 will increment every .8us in this
//setup overflows every 154.4us and interrupt every
//308.2us
set_timer2(0);  //this sets timer2 register to 0
time = get_timer2();  //this will read the timer1 register value
```

**Timer3**

Timer3 is very similar to timer1. So please refer to the [Timer1](#) section for more details.

**Timer4**

Timer4 is very similar to Timer2. So please refer to the [Timer2](#) section for more details.

**Timer5**

These options lets the user configure and use timer5. The clock/counter is 16-bit and is available only on 18Fxx31 devices. It counts up and also provides interrupt on overflow. The options available differ and are listed in the device header file.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_timer_5(mode)</td>
<td>Disables or sets the source and prescale for timer5</td>
</tr>
<tr>
<td>set_timer5(value)</td>
<td>Initializes the timer5 clock/counter</td>
</tr>
<tr>
<td>value = get_timer5</td>
<td>Returns the value of the timer5 clock/counter</td>
</tr>
</tbody>
</table>
### Functional Overview

**Relevant Preprocessor:**
None

**Relevant Interrupts:**
- **INT_TIMER5**: Interrupt fires when timer5 overflows

**Relevant Include Files:**
None, all functions built-in

**Relevant getenv() parameters:**
- **TIMER5**: Returns 1 if the device has timer5

**Example Code:**
For PIC18F4431
- `setup_timer_5(T5_DISABLED)` //disables timer5
- `setup_timer_5(T5_INTERNAL|T5_DIV_BY_1);` //sets the internal clock as source and prescale as 1.
  //At 20Mhz timer5 will increment every .2us in this
  //setup and overflows every 13.1072ms
- `set_timer5(0);` //this sets timer5 register to 0
- `time=get_timer5();` //this will read the timer5 register value

---

## TimerA

These options let the user configure and use timerA. It is available on devices with TimerA hardware. The clock/counter is 8 bit. It counts up and also provides interrupt on overflow. The options available are listed in the device's header file.

**Relevant Functions:**
- **setup_timer_A(mode)**: Disable or sets the source and prescale for timerA
- **set_timerA(value)**: Initializes the timerA clock/counter
- **value=get_timerA()**: Returns the value of the timerA clock/counter

**Relevant Preprocessor:**
None

**Relevant Interrupts:**
- **INT_TIMERA**: Interrupt fires when timerA overflows

**Relevant Include Files:**
None, all functions built-in

**Relevant getenv() parameters:**
- **TIMERA**: Returns 1 if the device has timerA
**Example Code:**

```c
setup_timer_A(TA_OFF);  //disable timerA
or
setup_timer_A       //sets the internal clock as source
(TA_INTERNAL |   //and prescale as 8. At 20MHz timerA will increment
TA_DIV_8);       //every 1.6us in this setup and overflows every
                 //409.6us

set_timerA(0);  //this sets timerA register to 0
time=get_timerA();  //this will read the timerA register value
```

**TimerB**

These options lets the user configure and use timerB. It is available on devices with TimerB hardware. The clock/counter is 8 bit. It counts up and also provides interrupt on overflow. The options available are listed in the device's header file.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_timer_B(mode)</td>
<td>Disable or sets the source and prescale for timerB</td>
</tr>
<tr>
<td>set_timerB(value)</td>
<td>Initializes the timerB clock/counter</td>
</tr>
<tr>
<td>value=get_timerB()</td>
<td>Returns the value of the timerB clock/counter</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**

None

**Relevant Interrupts:**

<table>
<thead>
<tr>
<th>Interrupt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INT_TIMERB</td>
<td>Interrupt fires when timerB overflows</td>
</tr>
</tbody>
</table>

**Relevant Include Files:**

None, all functions built-in

**Relevant getenv() parameters:**

**TIMERB**

Returns 1 if the device has timerB

**Example Code:**

```c
setup_timer_B(TB_OFF);  //disable timerB
or
setup_timer_B       //sets the internal clock as source
(TB_INTERNAL |   //and prescale as 8. At 20MHz timerB will increment
TB_DIV_8);       //every 1.6us in this setup and overflows every
                 //409.6us

set_timerB(0);  //this sets timerB register to 0
time=get_timerB();  //this will read the timerB register value
```
**USB**

Universal Serial Bus, or USB, is used as a method for peripheral devices to connect to and talk to a personal computer. CCS provides libraries for interfacing a PIC to PC using USB by using a PIC with an internal USB peripheral (like the PIC16C765 or the PIC18F4550 family) or by using any PIC with an external USB peripheral (the National USBN9603 family).

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>usb_init()</code></td>
<td>Initializes the USB hardware. Will then wait in an infinite loop for the USB peripheral to be connected to bus (but that doesn't mean it has been enumerated by the PC). Will enable and use the USB interrupt.</td>
</tr>
<tr>
<td><code>usb_init_cs()</code></td>
<td>The same as <code>usb_init()</code>, but does not wait for the device to be connected to the bus. This is useful if your device is not bus powered and can operate without a USB connection.</td>
</tr>
<tr>
<td><code>usb_task()</code></td>
<td>If you use connection sense, and the <code>usb_init_cs()</code> for initialization, then you must periodically call this function to keep an eye on the connection sense pin. When the PIC is connected to the BUS, this function will then prepare the USB peripheral. When the PIC is disconnected from the BUS, it will reset the USB stack and peripheral. Will enable and use the USB interrupt.</td>
</tr>
<tr>
<td><code>usb_detach()</code></td>
<td>Removes the PIC from the bus. Will be called automatically by <code>usb_task()</code> if connection is lost, but can be called manually by the user.</td>
</tr>
<tr>
<td><code>usb_attach()</code></td>
<td>Attaches the PIC to the bus. Will be called automatically by <code>usb_task()</code> if connection is made, but can be called manually by the user.</td>
</tr>
<tr>
<td><code>usb_attached()</code></td>
<td>If using connection sense pin (USB_CON_SENSE_PIN), returns TRUE if that pin is high. Else will always return TRUE.</td>
</tr>
<tr>
<td><code>usb_enumerated()</code></td>
<td>Returns TRUE if the device has been enumerated by the PC. If the device has been enumerated by the PC, that means it is in normal operation mode and you can send/receive packets.</td>
</tr>
<tr>
<td><code>usb_put_packet()</code></td>
<td>Places the packet of data into the specified endpoint buffer. Returns TRUE if success, FALSE if the buffer is still full with the last packet.</td>
</tr>
</tbody>
</table>

**Note:** In your application you must define USB_CON_SENSE_PIN to the connection sense pin.
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>usb_puts</strong> <em>(endpoint, data, len, timeout)</em></td>
<td>Sends the following data to the specified endpoint. <code>usb_puts()</code> differs from <code>usb_put_packet()</code> in that it will send multi packet messages if the data will not fit into one packet.</td>
</tr>
<tr>
<td><strong>usb_kbhit(endpoint)</strong></td>
<td>Returns TRUE if the specified endpoint has data in its receive buffer.</td>
</tr>
<tr>
<td><strong>usb_get_packet</strong> <em>(endpoint, ptr, max)</em></td>
<td>Reads up to max bytes from the specified endpoint buffer and saves it to the pointer <code>ptr</code>. Returns the number of bytes saved to <code>ptr</code>.</td>
</tr>
<tr>
<td><strong>usb_gets(endpoint, ptr, max, timeout)</strong></td>
<td>Reads a message from the specified endpoint. The difference <code>usb_get_packet()</code> and <code>usb_gets()</code> is that <code>usb_gets()</code> will wait until a full message has been received, which a message may contain more than one packet. Returns the number of bytes received.</td>
</tr>
</tbody>
</table>

**Relevant CDC Functions:**

A CDC USB device will emulate an RS-232 device, and will appear on your PC as a COM port. The follow functions provide you this virtual RS-232/serial interface.

Note: When using the CDC library, you can use the same functions above, but do not use the packet related function such as `usb_kbhit()`, `usb_get_packet()`, etc.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>usb_cdc_kbhit()</strong></td>
<td>The same as <code>kbhit()</code>, returns TRUE if there is 1 or more character in the receive buffer.</td>
</tr>
<tr>
<td><strong>usb_cdc_getc()</strong></td>
<td>The same as <code>getc()</code>, reads and returns a character from the receive buffer. If there is no data in the receive buffer it will wait indefinitely until there a character has been received.</td>
</tr>
<tr>
<td><strong>usb_cdc_putc(c)</strong></td>
<td>The same as <code>putc()</code>, sends a character. It actually puts a character into the transmit buffer, and if the transmit buffer is full will wait indefinitely until there is space for the character.</td>
</tr>
<tr>
<td><strong>usb_cdc_putc_fast(c)</strong></td>
<td>The same as <code>usb_cdc_putc()</code>, but will not wait indefinitely until there is space for the character in the transmit buffer. In that situation the character is lost.</td>
</tr>
<tr>
<td>*<em>usb_cdc_puts(<em>str)</em></em></td>
<td>Sends a character string (null terminated) to the USB CDC port. Will return FALSE if the buffer is busy, TRUE if buffer is string was put into buffer for sending. Entire string must fit into endpoint, if string is longer than endpoint buffer then excess characters will be ignored.</td>
</tr>
</tbody>
</table>
### Functional Overview

**Function:**

```c
usb_cdc_putready()
```

Returns TRUE if there is space in the transmit buffer for another character.

**Relevant Preprocessor:**

None

**Relevant Interrupts:**

A USB event has happened, and requires application intervention. The USB library that CCS provides handles this interrupt automatically.

```c
#define int_usb
```

**Relevant Include files:**

- `pic_usb.h` - Hardware layer driver for the PIC16C765 family PICmicro controllers with an internal USB peripheral.
- `pic18_usb.h` - Hardware layer driver for the PIC18F4550 family PICmicro controllers with an internal USB peripheral.
- `usbn960x.h` - Hardware layer driver for the National USBN9603/USBN9604 external USB peripheral. You can use this external peripheral to add USB to any microcontroller.
- `usb.h` - Common definitions and prototypes used by the USB driver.
- `usb.c` - The USB stack, which handles the USB interrupt and USB Setup Requests on Endpoint 0.
- `usb_cdc.h` - A driver that takes the previous include files to make a CDC USB device, which emulates an RS232 legacy device and shows up as a COM port in the MS Windows device manager.

**Relevant `getenv()` Parameters:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USB</td>
<td>Returns TRUE if the PICmicro controller has an integrated internal USB peripheral.</td>
</tr>
</tbody>
</table>

**Example Code:**

Due to the complexity of USB example code will not fit here. But you can find the following examples installed with your CCS C Compiler:

- `ex_usb_hid.c` - A simple HID device
- `ex_usb_mouse.c` - A HID Mouse, when connected to your PC the mouse cursor will go in circles.
- `ex_usb_kbmouse.c` - An example of how to create a USB device with multiple interfaces by creating a keyboard and mouse in one device.
### Voltage Reference

These functions configure the voltage reference module. These are available only in the supported chips.

**Relevant Functions:**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_vref(mode</td>
<td>value)</td>
</tr>
</tbody>
</table>

**Relevant Preprocessor:**

None

**Relevant Interrupts:**

None

**Relevant Include Files:**

None, all functions built-in

**Relevant getenv() parameters:**

VREF  Returns 1 if the device has VREF

---

Example code: for PIC12F675

```c
#define INT_COMP //comparator interrupt handler
void isr() {
    safe_conditions = FALSE;
    printf("WARNING!!!! Voltage level is above 3.6V. \r\n\n");
}

setup_comparator(A1 VR_OUT_ON_A2)//sets 2 comparators(A1 and VR and A2 as output)
{
    setup_vref(VREF_HIGH | 15);//sets 3.6(vdd * value/32 + vdd/4) if vdd is 5.0V
```
enable_interrupts(INT_COMP); // enable the comparator interrupt
enable_interrupts(GLOBAL); // enable global interrupts
}

## WDT or Watch Dog Timer

Different chips provide different options to enable/disable or configure the WDT.

### Relevant Functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setup_wdt()</td>
<td>Enables/disables the wdt or sets the prescalar.</td>
</tr>
<tr>
<td>restart_wdt()</td>
<td>Restarts the wdt, if wdt is enabled this must be periodically called to prevent a timeout reset.</td>
</tr>
</tbody>
</table>

For PCB/PCM chips it is enabled/disabled using WDT or NOWDT fuses whereas on PCH device it is done using the setup_wdt function.

The timeout time for PCB/PCM chips are set using the setup_wdt function and on PCH using fuses like WDT16, WDT256 etc.

RESTART_WDT when specified in #USE DELAY, #USE I2C and #USE RS232 statements like this #USE DELAY(clock=20000000, restart_wdt) will cause the wdt to restart if it times out during the delay or I2C_READ or GETC.

### Relevant Preprocessor:

<table>
<thead>
<tr>
<th>Preprocessor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#FUSES WDT/NOWDT</td>
<td>Enabled/Disables wdt in PCB/PCM devices</td>
</tr>
<tr>
<td>#FUSES WDT16</td>
<td>Sets ups the timeout time in PCH devices</td>
</tr>
</tbody>
</table>

### Relevant Interrupts:

None

### Relevant Include Files:

None, all functions built-in

### Relevant getenv() parameters:

None

### Example Code: for PIC16F877

```c
#fuses wdt
setup_wdt(WDT_2304MS);
while(true){
    restart_wdt();
    perform_activity();
}
```

### Example Code: for PIC18F452

```c
#fuse WDT1
setup_wdt(WDT_ON);
while(true){
    restart_wdt();
```
interrupt_enabled()

This function checks the interrupt enabled flag for the specified interrupt and returns TRUE if set.

**Syntax**

```c
interrupt_enabled(interrupt);
```

**Parameters**
- `interrupt` - constant specifying the interrupt

**Returns**
- Boolean value

**Function**
The function checks the interrupt enable flag of the specified interrupt and returns TRUE when set.

**Availability**
Devices with interrupts

**Requires**
Interrupt constants defined in the device's .h file.

**Examples**
```c
if(interrupt_enabled(INT_RDA))
    disable_interrupt(INT_RDA);
```

**Example Files**
None

**Also see**
DISABLE_INTERRUPTS(), Interrupts Overview, CLEAR_INTERRUPT(), ENABLE_INTERRUPTS(), INTERRUPT_ACTIVE()

### Stream I/O

**Syntax:**
```c
#include <ios.h> is required to use any of the ios identifiers.
```

**Output:**
```c
output:
stream << variable_or_constant_or_manipulator ;
```

one or more repeats

**stream** may be the name specified in the #use RS232 stream= option or for the default stream use cout.

**Output:**
```c
stream may also be the name of a char array. In this case the data is written to the array with a 0 terminator.
```

**stream** may also be the name of a function that accepts a single char parameter. In this case the function is called for each character to be output.

---

80
**variables/constants**: May be any integer, char, float or fixed type. Char arrays are output as strings and all other types are output as an address of the variable.

**manipulators**:
- `hex` - Hex format numbers
- `dec` - Decimal format numbers (default)
- `setprecision(x)` - Set number of places after the decimal point
- `setw(x)` - Set total number of characters output for numbers
- `boolalpha` - Output int1 as true and false
- `noboolalpha` - Output int1 as 1 and 0 (default)
- `fixed` - Floats in decimal format (default)
- `scientific` - Floats use E notation
- `iosdefault` - All manipulators to default settings
- `endl` - Output CR/LF
- `ends` - Outputs a null (\'\000\')

**Examples**:
```
cout << "Value is " << hex << data << endl;
cout << "Price is $" << setw(4) << setprecision(2) << cost << endl;
lcdputc << "f" << setw(3) << count << " min " << min << " max " << max;
string1 << setprecision(1) << sum / count;
string2 << x << ',' << y;
```

**stream >> variable_or_constant_or_manipulator**;

---

**Input**:
Make sure the function returns a \r to terminate the input statement.

variables/consts: May be any integer, char, float or fixed type. Char arrays are input as strings. Floats may use the E format. Reading of each item terminates with any character not valid for the type. Usually items are separated by spaces. The termination character is discarded. At the end of any stream input statement characters are read until a return (\r) is read. No termination character is read for a single char input.
manipulators:
- hex - Hex format numbers
- dec - Decimal format numbers (default)
- noecho - Suppress echoing
- nostrspace - Allow spaces to be input into strings
- iosdefault - All manipulators to default settings

**Examples:**
```cpp
cout << "Enter number: ";
cin >> value;
cout << "Enter title: ";
cin >> nostrspace >> title;
cin >> data[i].recordid >> data[i].xpos >> data[i].ypos >> data[i].sample;
string1 >> data;
lcdputc << \"Enter count\";
lcdputc << keypadgetc >> count; // read from keypad, echo to lcd
```

// This syntax only works with
// user defined functions.
PREPROCESSOR

PRE-PROCESSOR DIRECTORY

Pre-processor directives all begin with a # and are followed by a specific command. Syntax is dependent on the command. Many commands do not allow other syntactical elements on the remainder of the line. A table of commands and a description is listed on the previous page.

Several of the pre-processor directives are extensions to standard C. C provides a pre-processor directive that compilers will accept and ignore or act upon the following data. This implementation will allow any pre-processor directives to begin with #PRAGMA. To be compatible with other compilers, this may be used before non-standard features.

Examples:
Both of the following are valid
#INLINE
#PRAGMA INLINE

___address___

A predefined symbol ___address___ may be used to indicate a type that must hold a program memory address.

For example:

```plaintext
___address___ testa = 0x1000  //will allocate 16 bits for
test a and  //initialize to 0x1000

___attribute___x

Syntax:        ___attribute___ x
Elements:  x is the attribute you want to apply. Valid values for x are as follows:
             ((packed))
```
By default each element in a struct or union are padded to be evenly spaced by the size of 'int'. This is to prevent an address fault when accessing an element of struct. See the following example:

```c
struct
{
    int8 a;
    int16 b;
} test;
```

On architectures where 'int' is 16bit (such as dsPIC or PIC24 PICmicrocontrollers), 'test' would take 4 bytes even though it is comprised of 3 bytes. By applying the 'packed' attribute to this struct then it would take 3 bytes as originally intended:

```c
struct __attribute__((packed))
{
    int8 a;
    int16 b;
} test;
```

Care should be taken by the user when accessing individual elements of a packed struct – creating a pointer to 'b' in 'test' and attempting to dereference that pointer would cause an address fault. Any attempts to read/write 'b' should be done in context of 'test' so the compiler knows it is packed:

```c
test.b = 5;
```

((aligned(y))
By default the compiler will allocate a variable in the first free memory location. The aligned attribute will force the compiler to allocate a location for the specified variable at a location that is modulus of the y parameter. For example:

```c
int8 array[256] __attribute__((aligned(0x1000)));
```
This will tell the compiler to try to place 'array' at either 0x0, 0x1000, 0x2000, 0x3000, 0x4000, etc.

**Purpose**
To alter some specifics as to how the compiler operates

**Examples:**

```c
struct __attribute__((packed))
{
    int8 a;
    int8 b;
} test;
```

```c
int8 array[256] __attribute__((aligned(0x1000)));
```

**Example Files:**
None
#asm #endasm #asm asis

Syntax: #ASM or #ASM ASIS code #ENDASM

Elements: code is a list of assembly language instructions

Example

```c
int find_parity(int data){
    int count;
    #asm
    MOV #0x08, W0
    MOV W0, count
    CLR W0
    loop:
    XOR.B data,W0
    RRC data,W0
    DEC count,F
    BRA NZ, loop
    MOV #0x01,W0
    ADD count,F
    MOV count, W0
    MOV W0. _RETURN_
    #endasm
}
```

Example Files: FFT.c

</table>
The compiler will set the access bit depending on the value of the file register.

If there is just a variable identifier in the #asm block then the compiler inserts an & before it. And if it is an expression it must be a valid C expression that evaluates to a constant (no & here). In C an un-subscripted array name is a pointer and a constant (no need for &).

### #bit

**Syntax:**

```
#BIT id = x.y
```

**Elements:**
- `id` is a valid C identifier,
- `x` is a constant or a C variable,
- `y` is a constant 0-7

**Purpose:**

A new C variable (one bit) is created and is placed in memory at byte `x` and bit `y`. This is useful to gain access in C directly to a bit in the processors special function register map. It may also be used to easily access a bit of a standard C variable.

**Examples:**

```
#bit T0IF = 0x b.2
...
T1IF = 0; // Clear Timer 0 interrupt flag

int result;
#bit result_odd = result.0
...
if (result_odd)
```

**Example Files:**

`ex_glint.c`

**Also See:**

`#BYTE, #RESERVE, #LOCATE, #WORD`
Only defined if Options>Project Options>Global Defines has global defines enabled.

This id resolves to a number representing the number of successful builds of the project.

#build

Syntax:  
#BUILD(segment = address)  
#BUILD(segment = address, segment = address)  
#BUILD(segment = start:end)  
#BUILD(segment = start: end, segment = start: end)  
#BUILD(nosleep)

Elements:  
segment is one of the following memory segments which may be assigned a location: MEMORY, RESET, or INTERRUPT

directory is a ROM location memory address. Start and end are used to specify a range in memory to be used.

start is the first ROM location and end is the last ROM location to be used.

nosleep is used to prevent the compiler from inserting a sleep at the end of main()

Bootload produces a bootloader-friendly hex file (in order, full block size).

NOSLEEP_LOCK is used instead of a sleep at the end of a main A infinite loop.

Purpose:  
PIC18XXX devices with external ROM or PIC18XXX devices with no internal ROM can direct the compiler to utilize the ROM. When linking multiple compilation units, this directive must appear exactly the same in each compilation unit.

Examples:  
#build(memory=0x20000:0x2FFFF)  //Assigns memory space
#build(reset=0x200, interrupt=0x208)  //Assigns start
    //location
    //of reset and
    //interrupt
    //vectors

#build(reset=0x200:0x207, interrupt=0x208:0x2ff)  //Assign limited space
    //for reset and
    //interrupt vectors.

#build(memory=0x20000:0x2FFFF)  //Assigns memory space

Example Files: None

Also See:  
#LOCATE, #RESERVE, #ROM, #ORG
### #byte

**Syntax:**

```
#byte id = x
```

**Elements:**

- `id` is a valid C identifier,
- `x` is a C variable or a constant

**Purpose:**

If the `id` is already known as a C variable then this will locate the variable at address `x`. In this case the variable type does not change from the original definition. If the `id` is not known a new C variable is created and placed at address `x` with the type `int` (8 bit).

Warning: In both cases memory at `x` is not exclusive to this variable. Other variables may be located at the same location. In fact when `x` is a variable, then `id` and `x` share the same memory location.

**Examples:**

```
#byte status = 3
#byte b_port = 6

struct {
    short int r_w;
    short int c_d;
    int unused : 2;
    int data : 4 ; } a_port;

#byte a_port = 5
...
  a_port.c_d = 1;
```

**Example Files:**

`ex_glint.c`

**Also See:**

`#bit, #locate, #reserve, #word, Named Registers, Type Specifiers, Type Qualifiers, Enumerated Types, Structures & Unions, Typedef`

### #case

**Syntax:**

```
#CASE
```

**Elements:**

None

**Purpose:**

Will cause the compiler to be case sensitive. By default the compiler is case insensitive. When linking multiple compilation units, this directive must appear exactly the same in each compilation unit.
Warning: Not all the CCS example programs, headers and drivers have been tested with case sensitivity turned on.

**Examples:**

```c
#define case

int STATUS;

void func() {
    int status;
    ...
    STATUS = status; // Copy local status to
    // global
}
```

**Example Files:**
ex_cust.c

**Also See:** None

---

### _date_

**Syntax:** __DATE__

**Elements:** None

**Purpose:** This pre-processor identifier is replaced at compile time with the date of the compile in the form: "31-JAN-03"

**Examples:**

```c
printf("Software was compiled on ");
printf(__DATE__); 
```

**Example Files:** None

**Also See:** None

---

### #define

**Syntax:**

- `#define id text`
- `#define id(x,y...) text`

90
Elements:  
id is a preprocessor identifier, text is any text, \textit{x,y} is a list of local preprocessor identifiers, and in this form there may be one or more identifiers separated by commas.

Used to provide a simple string replacement of the ID with the given text from this point of the program and on.

In the second form (a C macro) the local identifiers are matched up with similar identifiers in the text and they are replaced with text passed to the macro where it is used.

If the text contains a string of the form \#idx then the result upon evaluation will be the parameter id concatenated with the string x.

Purpose:  
If the text contains a string of the form \#idx#idy then parameter idx is concatenated with parameter idy forming a new identifier.

Within the define text two special operators are supported:
\texttt{#x} is the stringize operator resulting in "x"
\texttt{x##y} is the concatenation operator resulting in xy

The varadic macro syntax is supported where the last parameter is specified as \texttt{...} and the local identifier used is \texttt{__va_args__}. In this case, all remaining arguments are combined with the commas.

Examples:  
\begin{verbatim}
#define BITS  8
a=a+BITS;  //same as  a=a+8;

#define hi(x)  (x<<4)
a=hi(a);    //same as  a=(a<<4);

#define isequal(a,b)  (primary_##a[b]==backup_##a[b])
// usage isequal(names,5)  is the same as
// (primary_names[5]==backup_names[5])

#define str(s)   s
#define part(device)  #include str(device##.h)
// usage part(16F887) is the same as
// #include "16F887.h"

#define DBG(...)  fprintf(debug,__VA_ARGS__)
\end{verbatim}

Example Files:  
\begin{verbatim}
ex_stwt.c, ex_macro.c
\end{verbatim}

Also See:  
\begin{verbatim}
#UNDEF, #IFDEF, #IFNDEF
\end{verbatim}
**definedinc**

**Syntax:**

\[ \text{value} = \text{definedinc}( \text{variable} ); \]

**Parameters:**

`variable` is the name of the variable, function, or type to be checked.

**Returns:**

A C status for the type of `id` entered as follows:

- 0 – not known
- 1 – typedef or enum
- 2 – struct or union type
- 3 – typemod qualifier
- 4 – defined function
- 5 – function prototype
- 6 – compiler built-in function
- 7 – local variable
- 8 – global variable

**Function:**

This function checks the type of the variable or function being passed in and returns a specific C status based on the type.

**Availability:** All devices

**Requires:** None

**Examples:**

```
int x, y = 0;
y = definedinc( x ); // y will return 7 – x is a local variable
```

**Example Files:**

None

**Also See:**

None

---

**#device**

**Syntax:**

```
#DEVICE chip options
#DEVICE Compilation mode selection
```

**Elements:**

`Chip Options`

`chip` is the name of a specific processor (like: PIC16C74 ), To get a current list of supported devices:

```
START | RUN | CCSC  +Q
```
**Options** are qualifiers to the standard operation of the device. Valid options are:

<table>
<thead>
<tr>
<th><strong>Option</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*=5</td>
<td>Use 5 bit pointers (for all parts)</td>
</tr>
<tr>
<td>*=8</td>
<td>Use 8 bit pointers (14 and 16 bit parts)</td>
</tr>
<tr>
<td>*=16</td>
<td>Use 16 bit pointers (for 14 bit parts)</td>
</tr>
<tr>
<td>ADC=x</td>
<td>Where x is the number of bits read_adc() should return</td>
</tr>
<tr>
<td>ICD=TRUE</td>
<td>Generates code compatible with Microchips ICD debugging hardware.</td>
</tr>
<tr>
<td>ICD=n</td>
<td>For chips with multiple ICSP ports specify the port number being used. The default is 1.</td>
</tr>
<tr>
<td>WRITE_EEPROM=ASYNC</td>
<td>Prevents WRITE_EEPROM from hanging while writing is taking place. When used, do not write to EEPROM from both ISR and outside ISR.</td>
</tr>
<tr>
<td>WRITE_EEPROM = NOINT</td>
<td>Allows interrupts to occur while the write_eeprom() operations is polling the done bit to check if the write operations has completed. Can be used as long as no EEPROM operations are performed during an ISR.</td>
</tr>
<tr>
<td>HIGH_INTS=TRUE</td>
<td>Use this option for high/low priority interrupts on the PIC® 18.</td>
</tr>
<tr>
<td>%f=</td>
<td>No 0 before a decimal pint on %f numbers less than 1.</td>
</tr>
<tr>
<td>OVERLOAD=KEYWORD</td>
<td>Overloading of functions is now supported. Requires the use of the keyword for overloading.</td>
</tr>
<tr>
<td>OVERLOAD=AUTO</td>
<td>Default mode for overloading.</td>
</tr>
<tr>
<td>PASS_STRINGS=IN_RAM</td>
<td>A new way to pass constant strings to a function by first copying the string to RAM and then passing a pointer to RAM to the function.</td>
</tr>
<tr>
<td>CONST=READ_ONLY</td>
<td>Uses the ANSI keyword CONST definition, making CONST variables read only, rather than located in program memory.</td>
</tr>
<tr>
<td>CONST=ROM</td>
<td>Uses the CCS compiler traditional keyword CONST definition, making CONST variables located in program memory.</td>
</tr>
<tr>
<td>NESTED_INTERRUPTS=TRUE</td>
<td>Enables interrupt nesting for PIC24, dsPIC30, and dsPIC33</td>
</tr>
</tbody>
</table>
devices. Allows higher priority interrupts to interrupt lower priority interrupts.

**NORETFIE**

ISR functions (preceded by a #int_xxx) will use a RETURN opcode instead of the RETFIE opcode. This is not a commonly used option; used rarely in cases where the user is writing their own ISR handler.

**NO_DIGITAL_INIT**

Normally the compiler sets all I/O pins to digital and turns off the comparator. This option prevents that action.

Both chip and options are optional, so multiple #DEVICE lines may be used to fully define the device. Be warned that a #DEVICE with a chip identifier, will clear all previous #DEVICE and #FUSE settings.

**Compilation mode selection**

The #DEVICE directive supports compilation mode selection. The valid keywords are CCS2, CCS3, CCS4 and ANSI. The default mode is CCS4. For the CCS4 and ANSI mode, the compiler uses the default fuse settings NOLVP, PUT for chips with these fuses. The NOWDT fuse is default if no call is made to restart_wdt().

**CCS4**

This is the default compilation mode. The pointer size for PCM and PCH is set to *=16 if the part has RAM over 0FF.

**ANSI**

Default data type is SIGNED all other modes default is UNSIGNED. Compilation is case sensitive, all other modes are case insensitive. Pointer size is set to *=16 if the part has RAM over 0FF.

**CCS2 CCS3**

var16 = NegConst8 is compiled as: var16 = NegConst8 & 0xff (no sign extension) Pointer size is set to *=8 for PCM and *=5 for PCB. The overload keyword is required.

**CCS2 only**

The default #DEVICE ADC is set to the resolution of the part, all other modes default to 8.

onebit = eightbits is compiled as onebit = (eightbits != 0)

All other modes compile as: onebit = (eightbits & 1)

**Chip Options**

- Defines the target processor. Every program must have exactly one #DEVICE with a chip. When linking multiple compilation units, this directive must appear exactly the same in each compilation unit.
Compilation mode selection - The compilation mode selection allows existing code to be compiled without encountering errors created by compiler compliance. As CCS discovers discrepancies in the way expressions are evaluated according to ANSI, the change will generally be made only to the ANSI mode and the next major CCS release.

Examples:

Chip Options -
#device PIC16C74
#device PIC16C67 *=16
#device *=16 ICD=TRUE
#device PIC16F877 *=16 ADC=10
#device %f=
printf("%f", .5); // will print .5, without the directive it will print 0.5

Compilation mode selection -
#device CCS2 // This will set the ADC to the resolution of the part

Example Files: ex_mxram.c, ex_icd.c, 16c74.h,

Also See: read_adc()

__device__

Syntax: __DEVICE__

Elements: None

Purpose: This pre-processor identifier is defined by the compiler with the base number of the current device (from a #DEVICE). The base number is usually the number after the C in the part number. For example the PIC16C622 has a base number of 622.

Examples:
#if __device__ == 71
SETUP_ADC_PORTS( ALL_DIGITAL );
#endif

Example Files: None

Also See: #DEVICE
#if expr  #else  #elif  #endif

Syntax:

```c
#if expr
  code
#endif
#elif expr
  code
#endif  //Optional, any number may be used
#else  //Optional
  code
#endif
```

Elements:

- `expr` is an expression with constants, standard operators and/or preprocessor identifiers.
- `Code` is any standard C source code.

The pre-processor evaluates the constant expression and if it is non-zero will process the lines up to the optional `#ELSE` or the `#ENDIF`.

Purpose:

Note: you may NOT use C variables in the #IF. Only preprocessor identifiers created via `#define` can be used.

The preprocessor expression `DEFINED(id)` may be used to return 1 if the id is defined and 0 if it is not.

`==` and `!=` operators now accept a constant string as both operands.

This allows for compile time comparisons and can be used with `GETENV()` when it returns a string result.

Examples:

```c
#if MAX_VALUE > 255
  long value;
#else
  int value;
#endif
#if getenv("DEVICE")=="PIC16F877"
  //do something special for the PIC16F877
#endif
```

Example Files:  

- `ex_extee.c`

Also See:  

- `#IFDEF`, `#IFNDEF`, `getenv()`

#error

Syntax:

```
#error text
#error / warning text
```
### #ERROR / information text

<table>
<thead>
<tr>
<th>Elements:</th>
<th>text is optional and may be any text</th>
</tr>
</thead>
</table>

| Purpose: | Forces the compiler to generate an error at the location this directive appears in the file. The text may include macros that will be expanded for the display. This may be used to see the macro expansion. The command may also be used to alert the user to an invalid compile time situation. |

| Examples: | #if BUFFER_SIZE>16  
#error Buffer size is too large  
#endif  
#error Macro test: min(x,y) |

| Example Files: | ex_psp.c |

| Also See: | #WARNING |

---

### #export (options)

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>#EXPORT (options)</th>
</tr>
</thead>
</table>

| Elements: | FILE=filename  
The filename which will be generated upon compile. If not given, the filename will be the name of the file you are compiling, with a .o or .hex extension (depending on output format).  
ONLY=symbol+symbol+......+symbol  
Only the listed symbols will be visible to modules that import or link this relocatable object file. If neither ONLY or EXCEPT is used, all symbols are exported.  
EXCEPT=symbol+symbol+......+symbol  
All symbols except the listed symbols will be visible to modules that import or link this relocatable object file. If neither ONLY or EXCEPT is used, all symbols are exported.  
RELOCATABLE  
CCS relocatable object file format. Must be imported or linked before loading into a PIC. This is the default format when the #EXPORT is used.  
HEX |
Intel HEX file format. Ready to be loaded into a PIC. This is the default format when no #EXPORT is used.

**RANGE=start:stop**
Only addresses in this range are included in the hex file.

**OFFSET=address**
Hex file address starts at this address (0 by default)

**ODD**
Only odd bytes placed in hex file.

**EVEN**
Only even bytes placed in hex file.

This directive will tell the compiler to either generate a relocatable object file or a stand-alone HEX binary. A relocatable object file must be linked into your application, while a stand-alone HEX binary can be programmed directly into the PIC.

The command line compiler and the PCW IDE Project Manager can also be used to compile/link/build modules and/or projects. Multiple #EXPORT directives may be used to generate multiple hex files. This may be used for 8722 like devices with external memory.

### Purpose:

### Examples:

```c
#define EXPORT(RELOCATABLE, ONLY=TimerTask)
void TimerFunc1(void) { /* some code */ } 
void TimerFunc2(void) { /* some code */ } 
void TimerFunc3(void) { /* some code */ } 
void TimerTask(void) 
{
   TimerFunc1();
   TimerFunc2();
   TimerFunc3();
}
/*
This source will be compiled into a relocatable object, but the object this is being linked to can only see TimerTask() */

Example Files:
None

See Also:
#IMPORT, #MODULE, Invoking the Command Line Compiler, Multiple Compilation Unit
### __FILE__

**Syntax:**  
__FILE__

**Elements:** None

**Purpose:** The pre-processor identifier is replaced at compile time with the file path and the filename of the file being compiled.

**Examples:**

```c
if(index>MAX_ENTRIES)
    printf("Too many entries, source file: "
    __FILE__ " at line " __LINE__ "\r\n");
```

**Example Files:**  
assert.h

**Also See:** __line__

### __FILENAME__

**Syntax:**  
__FILENAME__

**Elements:** None

**Purpose:** The pre-processor identifier is replaced at compile time with the filename of the file being compiled.

**Examples:**

```c
if(index>MAX_ENTRIES)
    printf("Too many entries, source file: 
    __FILENAME__ " at line " __LINE__ "\r\n");
```

**Example Files:** None

**Also See:** __line__

### #fill_rom

**Syntax:**  
#fill_rom value

---

99
## fill_rom

**Elements:** `value` is a constant 16-bit value

**Purpose:** This directive specifies the data to be used to fill unused ROM locations. When linking multiple compilation units, this directive must appear exactly the same in each compilation unit.

**Examples:**
```
#fill_rom 0x36
```

**Example Files:** None

**Also See:** #ROM

---

## #fuses

**Syntax:** `#FUSES options`

**Elements:** `options` vary depending on the device. A list of all valid options has been put at the top of each devices .h file in a comment for reference. The PCW device edit utility can modify a particular devices fuses. The PCW pull down menu VIEW | Valid fuses will show all fuses with their descriptions.

Some common options are:
- LP, XT, HS, RC
- WDT, NOWDT
- PROTECT, NOPROTECT
- PUT, NOPUT (Power Up Timer)
- BROWNOUT, NOBROWNOUT

This directive defines what fuses should be set in the part when it is programmed. This directive does not affect the compilation; however, the information is put in the output files. If the fuses need to be in Parallax format, add a PAR option. SWAP has the special function of swapping (from the Microchip standard) the high and low BYTES of non-program data in the Hex file. This is required for some device programmers.

**Purpose:**

Some fuses are set by the compiler based on other compiler directives. For example, the oscillator fuses are set up by the #USE delay directive. The debug, No debug and ICSPN Fuses are set by the #DEVICE ICD=directive.

Some processors allow different levels for certain fuses. To access
these levels, assign a value to the fuse. For example, on the 18F452, the fuse PROTECT=6 would place the value 6 into CONFIG5L, protecting code blocks 0 and 3.

When linking multiple compilation units be aware this directive applies to the final object file. Later files in the import list may reverse settings in previous files.

To eliminate all fuses in the output files use:

```
#FUSES none
```

To manually set the fuses in the output files use:

```
#FUSES 1 = 0xC200 // sets config word 1 to 0xC200
```

**Examples:**

```
#fuses  HS,NOWDT
```

**Example Files:**

`ex_sqw.c`

**Also See:** None

**#hexcomment**

**Syntax:**

```
#HEXCOMMENT text comment for the top of the hex file
#HEXCOMMENT\ text comment for the end of the hex file
```

**Elements:**

None

Puts a comment in the hex file

**Purpose:**

Some programmers (MPLAB in particular) do not like comments at the top of the hex file.

**Examples:**

```
#HEXCOMMENT Version 3.1 - requires 20MHz crystal
```

**Example Files:**

None

**Also See:** None
#id

## Syntax:

```
#ID number 16
#ID number, number, number, number
#ID "filename"
#ID CHECKSUM
```

### Elements:

- **Number 16** is a 16 bit number,
- **number** is a 4 bit number,
- **filename** is any valid PC filename and **checksum** is a keyword.

This directive defines the ID word to be programmed into the part. This directive does not affect the compilation but the information is put in the output file.

The first syntax will take a 16-bit number and put one nibble in each of the four ID words in the traditional manner. The second syntax specifies the exact value to be used in each of the four ID words.

When a filename is specified the ID is read from the file. The format must be simple text with a CR/LF at the end. The keyword CHECKSUM indicates the device checksum should be saved as the ID.

### Examples:

```
#id 0x1234
#id "serial.num"
#id CHECKSUM
```

### Example Files:

- `ex_cust.c`

### Also See:

- None

---

#ifdef  #ifndef  #else  #elif  #endif

## Syntax:

```
#IFDEF id
code
#ELIF id
code
#ELSE
code
#ENDIF

#IFNDEF id
```

## Syntax:

```
#IFDEF id
code
#ELIF id
code
#ELSE
code
#ENDIF

#IFNDEF id
```
<table>
<thead>
<tr>
<th>PreProcessor</th>

...  

#ifdef DEBUG  

printf("debug point a");  

#endif |
| Example Files: | ex_sqw.c |
| Also See: | #IF |

### #ignore_warnings

| Syntax: | #ignore_warnings ALL  

#IGNORE_WARNINGS NONE  

#IGNORE_WARNINGS warnings |
| Elements: | warnings is one or more warning numbers separated by commas |
| Purpose: | This function will suppress warning messages from the compiler. ALL indicates no warning will be generated. NONE indicates all warnings will be generated. If numbers are listed then those warnings are suppressed. |
| Examples: | #ignore_warnings 203  

while(TRUE) {  

#ignore_warnings NONE |
| Example Files: | None |
#import (options)

Syntax: 

```
#IMPORT (options)
```

Elements: 

- **FILE=filename**
  The filename of the object you want to link with this compilation.

- **ONLY=+symbol+......+symbol**
  Only the listed symbols will be imported from the specified relocatable object file. If neither ONLY or EXCEPT is used, all symbols are imported.

- **EXCEPT=+symbol+......+symbol**
  The listed symbols will not be imported from the specified relocatable object file. If neither ONLY or EXCEPT is used, all symbols are imported.

- **RELOCATABLE**
  CCS relocatable object file format. This is the default format when the #IMPORT is used.

- **COFF**
  COFF file format from MPASM, C18 or C30.

- **HEX**
  Imported data is straight hex data.

- **RANGE=start:stop**
  Only addresses in this range are read from the hex file.

- **LOCATION=id**
  The identifier is made a constant with the start address of the imported data.

- **SIZE=id**
  The identifier is made a constant with the size of the imported data.

Purpose: 

This directive will tell the compiler to include (link) a relocatable object with this unit during compilation. Normally all global symbols from the specified file will be linked, but the EXCEPT and ONLY options can prevent certain symbols from being linked.
The command line compiler and the PCW IDE Project Manager can also be used to compile/link/build modules and/or projects.

Examples:

```c
#include <16C54.H>
#include <C:\INCLUDES\COMLIB\MYRS232.C>
```

Example Files: `ex_sqw.c`
#inline

**Syntax:**

```
#INLINE
```

**Purpose:**
Tells the compiler that the function immediately following the directive is to be implemented INLINE. This will cause a duplicate copy of the code to be placed everywhere the function is called. This is useful to save stack space and to increase speed. Without this directive the compiler will decide when it is best to make procedures INLINE.

**Examples:**
```
#inline
swapbyte(int &a, int &b) {
    int t;
    t=a;
    a=b;
    b=t;
}
```

**Example Files:**
ex_cust.c

**Also See:**
#SEPARATE

#int_xxxx

</table>
#INT_ULPWU | Ultra-low power wake up interrupt
#INT_USB | Universal Serial Bus activity

Note many more #INT options are available on specific chips. Check the devices .h file for a full list for a given chip.

**Elements:** None

These directives specify the following function is an interrupt function. Interrupt functions may not have any parameters. Not all directives may be used with all parts. See the devices .h file for all valid interrupts for the part or in PCW use the pull down VIEW | Valid Ints.

The compiler will generate code to jump to the function when the interrupt is detected. It will generate code to save and restore the machine state, and will clear the interrupt flag. To prevent the flag from being cleared add NOCLEAR after the #INT_xxxx. The application program must call ENABLE_INTERRUPTS(INT_xxxx) to initially activate the interrupt along with the ENABLE_INTERRUPTS(GLOBAL) to enable interrupts.

The keywords HIGH and FAST may be used with the PCH compiler to mark an interrupt as high priority. A high-priority interrupt can interrupt another interrupt handler. An interrupt marked FAST is performed without saving or restoring any registers. You should do as little as possible and save any registers that need to be saved on your own. Interrupts marked HIGH can be used normally. See #DEVICE for information on building with high-priority interrupts.

**Purpose:**

A summary of the different kinds of PIC18 interrupts:

- **#INT_xxxx**
  - Normal (low priority) interrupt. Compiler saves/restores key registers.
  - This interrupt will not interrupt any interrupt in progress.
- **#INT_xxxx FAST**
  - High priority interrupt. Compiler DOES NOT save/restore key registers.
  - This interrupt will interrupt any normal interrupt in progress.
  - Only one is allowed in a program.
- **#INT_xxxx HIGH**
  - High priority interrupt. Compiler saves/restores key registers.
  - This interrupt will interrupt any normal interrupt in progress.
- **#INT_xxxx NOCLEAR**
  - The compiler will not clear the interrupt.

The user code in the function should call clear_interrupt( ) to clear the interrupt in this case.
Compiler generates no interrupt code. User function is located at address 8 for user interrupt handling.

Some interrupts shown in the devices header file are only for the enable/disable interrupts. For example, INT_RB3 may be used in enable/interruptions to enable pin B3. However, the interrupt handler is #INT_RB.

Similarly INT_EXT_L2H sets the interrupt edge to falling and the handler is #INT_EXT.

**Examples:**

```c
#int_ad
adc_handler() {
   adc_active=FALSE;
}

#int_rtcc noclear
isr() {
   ...
}
```

**Example Files:** See ex_sisr.c and ex_stwt.c for full example programs.

**Also See:** enable_interrupts(), disable_interrupts(), #INT_DEFAULT, #INT_GLOBAL, #PRIORITY

---

**#INT_DEFAULT**

**Syntax:**

```
#INT_DEFAULT
```

**Elements:** None

**Purpose:**

The following function will be called if the PIC® triggers an interrupt and none of the interrupt flags are set. If an interrupt is flagged, but is not the one triggered, the #INT_DEFAULT function will get called.

**Examples:**

```c
#int_default
default_isr() {
   printf("Unexplained interrupt\n");
}
```

**Example Files:** None

**Also See:** #INT xxxx, #INT_global
#int_global

Syntax:       #INT_GLOBAL

Elements:    None

Purpose:     This directive causes the following function to replace the compiler interrupt
dispatcher. The function is normally not required and should be used with
great caution. When used, the compiler does not generate start-up code or
clean-up code, and does not save the registers.

Examples:    #int_global
              isr() { // Will be located at location 4 for PIC16 chips.
              #asm
              bsf  isr_flag
              retfie
              #endasm
              }

Example Files: ex_glint.c

Also See:    #INT_xxxx

__line__

Syntax:      __line__

Elements:    None

Purpose:     The pre-processor identifier is replaced at compile time with line
number of the file being compiled.

Examples:    if(index>MAX_ENTRIES)
              printf("Too many entries, source file: "
              __FILE__ at line " __LINE__ "

Example Files: assert.h

Also See:    __file__
### #list

**Syntax:**

```
#LIST
```

**Elements:**

None

**Purpose:**

#LIST begins inserting or resumes inserting source lines into the .LST file after a #NOLIST.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
</table>
| ```
#NOLIST // Don't clutter up the list file
#include <cdriver.h>
#LIST
``` | 

**Example Files:**

16c74.h

**Also See:**

#NOLIST

---

### #line

**Syntax:**

```
#LINE number file name
```

**Elements:**

Number is non-negative decimal integer. File name is optional.

**Purpose:**

The C pre-processor informs the C Compiler of the location in your source code. This code is simply used to change the value of _LINE_ and _FILE_ variables.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
</table>
| 1. void main(){
    #line 10 // specifies the line number that
    // should be reported for
    // the following line of input

2. #line 7 "hello.c"
   // line number in the source file
   // hello.c and it sets the
   // line 7 as current line
   // and hello.c as current file | 

**Example Files:**

None

**Also See:**

None
#locate

Syntax:  

#LOCATE id=x

Elements:  

id is a C variable,  
x is a constant memory address

Purpose:  

#LOCATE allocates a C variable to a specified address. If the C variable was not previously defined, it will be defined as an INT8.

A special form of this directive may be used to locate all A functions local variables starting at a fixed location.  
Use: #LOCATE Auto = address

This directive will place the indirectioned C variable at the requested address.

Examples:  

// This will locate the float variable at 50-53  
// and C will not use this memory for other  
// variables automatically located.  
float x;  
#locate x=0x 50

Example Files:  
ex_glint.c

Also See:  

#byte, #bit, #reserve, #word, Named Registers, Type Specifiers, Type Qualifiers, Enumerated Types, Structures & Unions, Typedef

#module

Syntax:  

#MODULE

Elements:  

None

Purpose:  

All global symbols created from the #MODULE to the end of the file will only be visible within that same block of code (and files #INCLUDE within that block). This may be used to limit the scope of global variables and functions within include files. This directive also applies to pre-processor #defines.  
Note: The extern and static data qualifiers can also be used to denote
scope of variables and functions as in the standard C methodology. #MODULE does add some benefits in that pre-processor #DEFINE can be given scope, which cannot normally be done in standard C methodology.

Examples:

```c
int GetCount(void);
void SetCount(int newCount);

#define G_COUNT_MAX 100
int GetCount(void) {return(g_count);}
void SetCount(int newCount) {
  if (newCount>G_COUNT_MAX)
    newCount=G_COUNT_MAX;
  g_count=newCount;
}

/*
the functions GetCount() and SetCount() have global scope,
but the variable g_count and the #define G_COUNT_MAX only
has scope to this file.
*/
```

Example Files: None

See Also: #EXPORT, Invoking the Command Line Compiler, Multiple Compilation Unit

#nolist

Syntax: #NOLIST

Elements: None

Purpose: Stops inserting source lines into the .LST file (until a #LIST)

Examples:

```c
#NOLIST // Don't clutter up the list file
#include <cdriver.h>
#LIST
```

Example Files: 16c74.h

Also See: #LIST
### #ocs

**Syntax:**

```
#OCS  x
```

**Elements:**

- `x` is the clock's speed and can be 1 Hz to 100 MHz.

**Purpose:**

- Used instead of the `#use delay(clock = x)`

**Examples:**

```c
#include <18F4520.h>
device ICD=TRUE
#OCS 20 MHz
#use rs232(debugger)

void main(){
   ------;
}
```

**Example Files:**

- None

**Also See:**

- #USE DELAY

### #opt

**Syntax:**

```
#OPT  n
```

**Elements:**

- All Devices: `n` is the optimization level 1-9 or by using the word "compress" for PIC18 and Enhanced PIC16 families.

**Purpose:**

- The optimization level is set with this directive. This setting applies to the entire program and may appear anywhere in the file. The PCW default is 9 for normal. When Compress is specified the optimization is set to an extreme level that causes a very tight rom image, the code is optimized for space, not speed. Debugging with this level may be more difficult.

**Examples:**

- `#opt  5`

**Example Files:**

- None

**Also See:**

- None
#org

**Syntax:**

<table>
<thead>
<tr>
<th>#ORG</th>
<th>start, end</th>
</tr>
</thead>
<tbody>
<tr>
<td>#ORG</td>
<td>segment</td>
</tr>
<tr>
<td>or</td>
<td>start, end { }</td>
</tr>
<tr>
<td>or</td>
<td>start, end auto=0</td>
</tr>
<tr>
<td>#ORG</td>
<td>start, end DEFAULT</td>
</tr>
<tr>
<td>or</td>
<td>DEFAULT</td>
</tr>
</tbody>
</table>

**Elements:**

- **start** is the first ROM location (word address) to use, **end** is the last ROM location, **segment** is the start ROM location from a previous #ORG.

This directive will fix the following function, constant or ROM declaration into a specific ROM area. End may be omitted if a segment was previously defined if you only want to add another function to the segment.

Follow the ORG with a { } to only reserve the area with nothing inserted by the compiler.

The RAM for a ORG'd function may be reset to low memory so the local variables and scratch variables are placed in low memory. This should only be used if the ORG'd function will not return to the caller. The RAM used will overlap the RAM of the main program. Add a AUTO=0 at the end of the #ORG line.

**Purpose:**

If the keyword DEFAULT is used then this address range is used for all functions user and compiler generated from this point in the file until a #ORG DEFAULT is encountered (no address range). If a compiler function is called from the generated code while DEFAULT is in effect the compiler generates a new version of the function within the specified address range.

#ORG may be used to locate data in ROM. Because CONSTANT are implemented as functions the #ORG should proceed the CONSTANT and needs a start and end address. For a ROM declaration only the start address should be specified.

When linking multiple compilation units be aware this directive applies
to the final object file. It is an error if any #ORG overlaps between files unless the #ORG matches exactly.

**Examples:**

```c
#ORG 0x1E00, 0x1FFF
MyFunc() {
    // This function located at 1E00
}

#ORG 0x1E00
Anotherfunc(){
    // This will be somewhere 1E00-1F00
}

#ORG 0x800, 0x820 {}
// Nothing will be at 800-820

#ORG 0x1B80
ROM int32 seridl_N0=12345;

#ORG 0x1C00, 0x1C0F
CHAR CONST ID[10]= {"123456789"};
// This ID will be at 1C00
// Note some extra code will
// proceed the 123456789

#ORG 0x1F00, 0x1FF0
Void loader (){.
. .
}
```

**Example Files:**

`loader.c`

**Also See:**

`#ROM`

---

**#pin_select**

**Syntax:**

```
#PIN_SELECT function=pin_xx
```

**Elements:**

*function* is the Microchip defined pin function name, such as: U1RX (UART1 receive), INT1 (external interrupt 1), T2CK (timer 2 clock), IC1 (input capture 1), OC1 (output capture 1).

<p>| INT1       | External Interrupt 1 |
| INT2   | External Interrupt 2                  |
| INT3   | External Interrupt 3                  |
| T0C    | Timer0 External Clock                |
| T3C    | Timer3 External Clock                |
| CCP 1  | Input Capture 1                      |
| CCP 2  | Input Capture 2                      |
| T1G    | Timer1 Gate Input                    |
| T3G    | Timer3 Gate Input                    |
| U2R    | EUSART2 Asynchronous Receive/Synchronous Receive (also named: RX2) |
| U2C    | EUSART2 Asynchronous Clock Input     |
| SDI 2  | SPI2 Data Input                      |
| SCK 2IN| SPI2 Clock Input                     |

</tr>
</tbody>
</table>

*pin_xx is the CCS provided pin definition. For example: PIN_C7, PIN_B0, PIN_D3, etc.*

**Purpose:**
When using PPS chips a `#PIN_SELECT` must appear before these peripherals can be used or referenced.

**Examples:**
- `#pin_select U1TX=PIN_C6`
- `#pin_select U1RX=PIN_C7`
- `#pin_select INT1=PIN_B0`

**Example Files:**
None

**Also See:** `pin_select()`
### __pcb__

**Syntax:** __PCB__

**Elements:** None

**Purpose:** The PCB compiler defines this pre-processor identifier. It may be used to determine if the PCB compiler is doing the compilation.

**Examples:**
```c
#ifdef __pcb__
#device PIC16c54
#endif
```

**Example Files:** ex_sqw.c

**Also See:** __PCM__, __PCH__

### __pcm__

**Syntax:** __PCM__

**Elements:** None

**Purpose:** The PCM compiler defines this pre-processor identifier. It may be used to determine if the PCM compiler is doing the compilation.

**Examples:**
```c
#ifdef __pcm__
#device PIC16c71
#endif
```

**Example Files:** ex_sqw.c

**Also See:** __PCB__, __PCH__
### `__pch__`

**Syntax:**
```
__PCH__
```

**Elements:**
None

**Purpose:**
The PCH compiler defines this pre-processor identifier. It may be used to determine if the PCH compiler is doing the compilation.

**Examples:**
```
#ifdef __PCH__
#device PIC18C452
#endif
```

**Example Files:**
`ex_sqw.c`

**Also See:**
`__PCB__`, `__PCM__`

### `#pragma`

**Syntax:**
```
#PRAGMA cmd
```

**Elements:**
`cmd` is any valid preprocessor directive.

**Purpose:**
This directive is used to maintain compatibility between C compilers. This compiler will accept this directive before any other preprocessor command. In no case does this compiler require this directive.

**Examples:**
```
#pragma device PIC16C54
```

**Example Files:**
`ex_cust.c`

**Also See:**
None

### `#priority`

**Syntax:**
```
#PRIORITY ints
```

**Elements:**
`ints` is a list of one or more interrupts separated by commas.

`export` makes the functions generated from this directive available to other compilation units within the link.

**Purpose:**
The priority directive may be used to set the interrupt priority. The highest priority items are first in the list. If an interrupt is active it is...
never interrupted. If two interrupts occur at around the same time then the higher one in this list will be serviced first. When linking multiple compilation units be aware only the one in the last compilation unit is used.

Examples:  
#priority rtcc,rb

Example Files:  
None

Also See:  
#INT xxxx

#profile

Syntax:  
#profile options

Elements:  
*options* may be one of the following:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>functions</td>
<td>Profiles the start/end of functions and all profileout() messages.</td>
</tr>
<tr>
<td>functions,</td>
<td>Profiles the start/end of functions, parameters</td>
</tr>
<tr>
<td>parameters</td>
<td>sent to functions, and all profileout() messages.</td>
</tr>
<tr>
<td>profileout</td>
<td>Only profile profilout() messages.</td>
</tr>
<tr>
<td>paths</td>
<td>Profiles every branch in the code.</td>
</tr>
<tr>
<td>off</td>
<td>Disable all code profiling.</td>
</tr>
<tr>
<td>on</td>
<td>Re-enables the code profiling that was previously disabled with a #profile off command. This will use the last options before disabled with the off command.</td>
</tr>
</tbody>
</table>

Purpose:  
Large programs on the microcontroller may generate lots of profile data, which may make it difficult to debug or follow. By using #profile the user can dynamically control which points of the program are being profiled, and limit data to what is relevant to the user.

Examples:  
#profile off

```c
void BigFunction(void)
{
    // BigFunction code goes here.
    // Since #profile off was called above,
    // no profiling will happen even for other
    // functions called by BigFunction().
}
```

#profile on

Example Files: ex_profile.c

Also See: #use profile(), profileout(), Code Profile overview

---

### #reserve

**Syntax:**

```
#RESERVE address
or
#RESERVE address, address, address
or
#RESERVE start:end
```

**Elements:**

- `address` is a RAM address, `start` is the first address and `end` is the last address.

**Purpose:**

This directive allows RAM locations to be reserved from use by the compiler. #RESERVE must appear after the #DEVICE otherwise it will have no effect. When linking multiple compilation units be aware this directive applies to the final object file.

**Examples:**

```
#DEVICE PIC16C74
#RESERVE 0x60:0X6f
```

Example Files: ex_cust.c

Also See: #ORG

---

### #rom

**Syntax:**

```
#ROM address = {list}
#ROM type address = {list}
```

**Elements:**

- `address` is a ROM word address, `list` is a list of words separated by commas

**Purpose:**

Allows the insertion of data into the .HEX file. In particular, this may be used to program the '84 data EEPROM, as shown in the following example.
Note that if the #ROM address is inside the program memory space, the directive creates a segment for the data, resulting in an error if a #ORG is over the same area. The #ROM data will also be counted as used program memory space.

The type option indicates the type of each item, the default is 16 bits. Using char as the type treats each item as 7 bits packing 2 chars into every pcm 14-bit word.

When linking multiple compilation units be aware this directive applies to the final object file.

Some special forms of this directive may be used for verifying program memory:

#ROM address = checksum
  This will put a value at address such that the entire program memory will sum to 0x1248

#ROM address = crc16
  This will put a value at address that is a crc16 of all the program memory except the specified address

#ROM address = crc16(start, end)
  This will put a value at address that is a crc16 of all the program memory from start to end.

#ROM address = crc8
  This will put a value at address that is a crc16 of all the program memory except the specified address

Examples:
#rom getnev ("EEPROM_ADDRESS")={1,2,3,4,5,6,7,8}
#rom int8 0x1000={"(c)CCS, 2010"}

Example Files: None

Also See: #ORG

#SEPARATE

Syntax: #SEPARATE

Elements: None

Purpose: Tells the compiler that the procedure IMMEDIATELY following the
directive is to be implemented SEPARATELY. This is useful to prevent the compiler from automatically making a procedure INLINE. This will save ROM space but it does use more stack space. The compiler will make all procedures marked SEPARATE, separate, as requested, even if there is not enough stack space to execute.

Examples:

```c
#separate
swapbyte (int *a, int *b) {
    int t;
    t=*a;
    *a=*b;
    *b=t;
}
```

Example Files:  
ex_cust.c

Also See:  
#INLINE

---

**#serialize**

**Syntax:**

```
#SERIALIZE(id=xxx, next="x" | file="filename.txt" " | listfile="filename.txt", "prompt="text", log="filename.txt") -
or
#SERIALIZE(dataee=x, binary=x, next="x" | file="filename.txt" | listfile="filename.txt", prompt="text", log="filename.txt")
```

**Elements:**

- `id=xxx` - Specify a C CONST identifier, may be int8, int16, int32 or char array

  Use in place of id parameter, when storing serial number to EEPROM:

  - `dataee=x` - The address x is the start address in the data EEPROM.
  - `binary=x` - The integer x is the number of bytes to be written to address specified.
  - `string=x` - The integer x is the number of bytes to be written to address specified.
  - `unicode=n` - If n is a 0, the string format is normal unicode. For n>0 n indicates the string number in a USB descriptor.

  Use only one of the next three options:

  - `file="filename.txt"` - The file x is used to read the initial serial number from, and this file is updated by the ICD programmer. It is assumed this is a one line file with the serial number. The programmer will increment the serial number.
  - `listfile="filename.txt"` - The file x is used to read the initial serial number from, and this file is updated by the ICD programmer. It is assumed this is a one line file with the serial number. The programmer will increment the serial number.
number from, and this file is updated by the ICD programmer. It is assumed this is a file one serial number per line. The programmer will read the first line then delete that line from the file.

next="x" - The serial number X is used for the first load, then the hex file is updated to increment x by one.

Other optional parameters: 
prompt="text" - If specified the user will be prompted for a serial number on each load. If used with one of the above three options then the default value the user may use is picked according to the above rules.

log=xxx - A file may optionally be specified to keep a log of the date, time, hex file name and serial number each time the part is programmed. If no id=xxx is specified then this may be used as a simple log of all loads of the hex file.

Purpose: Assists in making serial numbers easier to implement when working with CCS ICD units. Comments are inserted into the hex file that the ICD software interprets.

Examples:
//Prompt user for serial number to be placed
//at address of serialNumA
//Default serial number = 200 int8 int8 const
serialNumA=100;
#serialize(id=serialNumA,next="200",prompt="Enter the serial number")

//Adds serial number log in seriallog.txt
#serialize(id=serialNumA,next="200",prompt="Enter the serial number", log="seriallog.txt")

//Retrieves serial number from serials.txt
#serialize(id=serialNumA,listfile="serials.txt")

//Place serial number at EEPROM address 0, reserving 1 byte
#serialize(dataee=0,binary=1,next="45",prompt="Put in Serial number")

//Place string serial number at EEPROM address 0, reserving 2 bytes
#serialize(dataee=0, string=2,next="AB",prompt="Put in Serial number")

Example Files: None
Also See: None
#task

(The RTOS is only included with the PCW, PCWH, and PCWHD software packages.)

Each RTOS task is specified as a function that has no parameters and no return. The #TASK directive is needed just before each RTOS task to enable the compiler to tell which functions are RTOS tasks. An RTOS task cannot be called directly like a regular function can.

Syntax:  
#TASK (options)

Elements:  
options are separated by comma and may be:
rate=time  
Where time is a number followed by s, ms, us, or ns. This specifies how often the task will execute.

max=time  
Where time is a number followed by s, ms, us, or ns. This specifies the budgeted time for this task.

queue=bytes  
Specifies how many bytes to allocate for this task's incoming messages. The default value is 0.

enabled=value  
Specifies whether a task is enabled or disabled by rtos_run( ). True for enabled, false for disabled. The default value is enabled.

This directive tells the compiler that the following function is an RTOS task.

The rate option is used to specify how often the task should execute. This must be a multiple of the minor_cycle option if one is specified in the #USE RTOS directive.

The max option is used to specify how much processor time a task will use in one execution of the task. The time specified in max must be equal to or less than the time specified in the minor_cycle option of the #USE RTOS directive before the project will compile successfully. The compiler does not have a way to enforce this limit on processor time, so a programmer must be careful with how much processor time a task uses for execution. This option does not need to be specified.

The queue option is used to specify the number of bytes to be
reserved
for the task to receive messages from other tasks or functions. The
default queue value is 0.

Examples:  
#task(rate=1s, max=20ms, queue=5)

Also See:  
#USE RTOS

__time__

Syntax:  
__TIME__

Elements:  
None

Purpose:  
This pre-processor identifier is replaced at compile time with the time
of the compile in the form: "hh:mm:ss"

Examples:  
printf("Software was compiled on ");
printf(__TIME__);  

Example Files:  
None

Also See:  
None

#type

Syntax:  
#TYPE standard-type=size
#TYPE default=area
#TYPE unsigned
#TYPE signed

Elements:  
standard-type is one of the C keywords short, int, long, or default
size is 1,8,16, or 32
area is a memory region defined before the #TYPE using the
addressmod directive

Purpose:  
By default the compiler treats SHORT as one bit, INT as 8 bits, and
LONG as 16 bits. The traditional C convention is to have INT defined
as the most efficient size for the target processor. This is why it is 8
bits on the PIC®. In order to help with code compatibility a #TYPE
directive may be used to allow these types to be changed. #TYPE can
redefine these keywords.

Note that the commas are optional. Since #TYPE may render some sizes inaccessible (like a one bit int in the above) four keywords representing the four ints may always be used: INT1, INT8, INT16, and INT32. Be warned CCS example programs and include files may not work right if you use #TYPE in your program.

This directive may also be used to change the default RAM area used for variable storage. This is done by specifying default=area where area is a addressmod address space.

When linking multiple compilation units be aware this directive only applies to the current compilation unit.

The #TYPE directive allows the keywords UNSIGNED and SIGNED to set the default data type.

Examples:

```c
#TYPE SHORT= 8 , INT= 16 , LONG= 32

#TYPE default=area

addressmod (user_ram_block, 0x100, 0x1FF);

#type default=user_ram_block  // all variable declarations
    // in this area will be in
    // 0x100-0x1FF

#type default=                     // restores memory
allocation                     // back to normal

#TYPE SIGNED

...

void main()
{
    int variable1;  // variable1 can only take values from -
                     // 128 to 127
    ...
    ...
}
```

Example Files:  

`ex_cust.c`

Also See:  

None
#undefined

**Syntax:**

```
#UNDEF id
```

**Elements:**

`id` is a pre-processor id defined via `#DEFINE`

**Purpose:**

The specified pre-processor ID will no longer have meaning to the pre-processor.

**Examples:**

```c
#if MAXSIZE<100
#undef MAXSIZE
#define MAXSIZE 100
#endif
```

**Example Files:**

None

**Also See:**

`#DEFINE`

__unicode

**Syntax:**

```
__unicode( constant-string )
```

**Elements:**

Unicode format string

This macro will convert a standard ASCII string to a Unicode format string by inserting a `\000` after each character and removing the normal C string terminator.

For example: `__unicode("ABCD")`
will return: `"A\00B\00C\00D"` (8 bytes total with the terminator)

**Purpose**

Since the normal C terminator is not used for these strings you need to do one of the following for variable length strings:

- `string = __unicode(KEYWORD) "\000\000";
- OR
- `string = __unicode(KEYWORD);
  string_size = sizeof(__unicode(KEYWORD));`
### Examples:

```c
#define USB_DESC_STRING_TYPE 3

#define USB_STRING(x) (sizeof(_unicode(x))+2),USB_DESC_STRING_TYPE,_unicode(x)

#define USB_ENGLISH_STRING 4,USB_DESC_STRING_TYPE,0x09,0x04

// Microsoft Defined for US-English

char const USB_STRING_DESC[] = {
    USB_ENGLISH_STRING,
    USB_STRING("CCS"),
    USB_STRING("CCS HID DEMO")
};
```

### Example Files:

`usb_desc_hid.h`

---

**#use capture**

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>#USE CAPTURE(options)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elements:</td>
<td>ICx/CCPx</td>
</tr>
<tr>
<td></td>
<td>Which CCP/Input Capture module to use.</td>
</tr>
</tbody>
</table>

- **INPUT = PIN_xx**
  - Specifies which pin to use. Useful for device with remappable pins, this will cause compiler to automatically assign pin to peripheral.

- **TIMER=x**
  - Specifies the timer to use with capture unit. If not specified default to timer 1 for PCM and PCH compilers and timer 3 for PCD compiler.

- **TICK=x**
  - The tick time to setup the timer to. If not specified it will be set to fastest as possible or if same timer was already setup by a previous stream it will be set to that tick time. If using same timer as previous stream and different tick time an error will be generated.

  - **FASTEST**
    - Use instead of TICK=x to set tick time to fastest as possible.

  - **SLOWEST**
Use instead of `TICK=x` to set tick time to slowest as possible.

**CAPTURE_RISING**
Specifies the edge that timer value is captured on.
Defaults to `CAPTURE_RISING`.

**CAPTURE_FALLING**
Specifies the edge that timer value is captured on.
Defaults to `CAPTURE_RISING`.

**CAPTURE_BOTH**
PCD only. Specifies the edge that timer value is captured on.
Defaults to `CAPTURE_RISING`.

**PRE=x**
Specifies number of rising edges before capture event occurs. Valid options are 1, 4 and 16, default to 1 if not specified. Options 4 and 16 are only valid when using `CAPTURE_RISING`, will generate an error is used with `CAPTURE_FALLING` or `CAPTURE_BOTH`.

**ISR=x**

**STREAM=id**
Associates a stream identifier with the capture module. The identifier may be used in functions like `get_capture_time()`.

**DEFINE=id**
Creates a define named id which specifies the number of capture per second. Default define name if not specified is `CAPTURES_PER_SECOND`. Define name must start with an ASCII letter 'A' to 'Z', an ASCII letter 'a' to 'z' or an ASCII underscore ('_').

Purpose:
This directive tells the compiler to setup an input capture on the specified pin using the specified settings. The `#USE DELAY` directive must appear before this directive can be used. This directive enables use of built-in functions such as `get_capture_time()` and `get_capture_event()`.

Examples:
```
#USE CAPTURE(INPUT=PIN_C2,CAPTURE_RISING,TIMER=1,FASTEST)
```

Example Files:
None.

Also See: `get_capture_time()`, `get_capture_event()`
#use delay

## Syntax:

`#USE DELAY (options)`

## Elements:

Options may be any of the following separated by commas:

- **clock=speed** speed is a constant 1-100000000 (1 hz to 100 mhz). This number can contains commas. This number also supports the following denominations: M, MHZ, K, KHZ. This specifies the clock the CPU runs at. Depending on the PIC this is 2 or 4 times the instruction rate. This directive is not needed if the following type=speed is used and there is no frequency multiplication or division.

- **type=speed** type defines what kind of clock you are using, and the following values are valid: oscillator, osc (same as oscillator), crystal, xtal (same as crystal), internal, int (same as internal) or rc. The compiler will automatically set the oscillator configuration bits based upon your defined type. If you specified internal, the compiler will also automatically set the internal oscillator to the defined speed. Configuration fuses are modified when this option is used. Speed is the input frequency.

- **restart_wdt** will restart the watchdog timer on every delay_us() and delay_ms() use.

- **clock_out** when used with the internal or oscillator types this enables the clockout pin to output the clock.

- **fast_start** some chips allow the chip to begin execution using an internal clock until the primary clock is stable.

- **lock** some chips can prevent the oscillator type from being changed at run time by the software.

- **USB or USB_FULL** for devices with a built-in USB peripheral. When used with the **type=speed** option the compiler will set the correct configuration bits for the USB peripheral to operate at Full-Speed.

- **USB_LOW** for devices with a built-in USB peripheral. When used with the **type=speed** option the compiler will set the correct configuration bits for the USB peripheral to operate at Low-Speed.

- **PLL_WAIT** for devices with a PLL and a PLL Ready Status flag to test. When a PLL clock is specified it will cause the compiler to poll the ready PLL Ready Flag and only continue program execution when flag indicates that the PLL is ready.
**ACT or ACT=type** for device with Active Clock Tuning, type can be either USB or SOSC. If only using ACT type will default to USB. ACT=USB causes the compiler to enable the active clock tuning and to tune the internal oscillator to the USB clock. ACT=SOSC causes the compiler to enable the active clock tuning and to tune the internal oscillator to the secondary clock at 32.768 kHz. ACT can only be used when the system clock is set to run from the internal oscillator.

Also See: [delay_ms()], [delay_us()]

---

**#use dynamic_memory**

**Syntax:**

```
#USE DYNAMIC_MEMORY
```

**Elements:**

None

**Purpose:**

This pre-processor directive instructs the compiler to create the _DYNAMIC_HEAD object. _DYNAMIC_HEAD is the location where the first free space is allocated.

**Examples:**

```
#USE DYNAMIC_MEMORY
void main (){ }
```

**Example Files:**

ex_malloc.c

**Also See:**

None

---

**#use fast_io**

**Syntax:**

```
#USE FAST_IO (port)
```

**Elements:**

*port* is A, B, C, D, E, F, G, H, J or ALL

**Purpose:**

Affects how the compiler will generate code for input and output instructions that follow. This directive takes effect until another #use xxxx_IO directive is encountered. The fast method of doing I/O will cause the compiler to perform I/O without programming of the direction register. The compiler's default operation is the opposite of this command, the direction I/O will be set/cleared on each I/O operation. The user must ensure the direction register is set correctly via
set_tris_X(). When linking multiple compilation units be aware this directive only applies to the current compilation unit.

**Examples:**

```
#use fast_io(A)
```

**Example Files:**

`ex_cust.c`

**Also See:**

`#USE FIXED_IO, #USE STANDARD_IO, set_tris_X, General Purpose I/O`

---

### #use fixed_io

**Syntax:**

```
#USE FIXED_IO (port_outputs=pin, pin?)
```

**Elements:**

- `port` is A-G, `pin` is one of the pin constants defined in the devices .h file.

**Purpose:**

This directive affects how the compiler will generate code for input and output instructions that follow. This directive takes effect until another `#USE XXX_IO` directive is encountered. The fixed method of doing I/O will cause the compiler to generate code to make an I/O pin either input or output every time it is used. The pins are programmed according to the information in this directive (not the operations actually performed). This saves a byte of RAM used in standard I/O. When linking multiple compilation units be aware this directive only applies to the current compilation unit.

**Examples:**

```
#use fixed_io(a_outputs=PIN_A2, PIN_A3)
```

**Example Files:**

None

**Also See:**

`#USE FAST_IO, #USE STANDARD_IO, General Purpose I/O`

---

### #use i2c

**Syntax:**

```
#USE I2C (options)
```

**Elements:**

- `Options` are separated by commas and may be:
  - `MASTER` — Sets to the master mode
  - `MULTI_MASTER` — Set the multi_master mode
### CCS C Compiler

<table>
<thead>

<td>No initialization of the I2C peripheral is performed. Use I2C_INIT() to initialize peripheral at run time.</td>
</tr>
</tbody>
</table>

Only some chips allow the following:

| DATA_HOLD | No ACK is sent until I2C_READ is called (slave only) |
| ADDRESS_HOLD | No ACK is sent until I2C_read is called for the address byte (slave only) |
| SDA_HOLD | Min of 300ns holdtime on SDA a from SCL |

### Purpose:

CCS offers support for the hardware-based I2C™ and a software-based master I2C™ device. (For more information on the hardware-based I2C module, please consult the datasheet for your target device; not all PICs support I2C™.)

The I2C library contains functions to implement an I2C bus. The #USE
I2C remains in effect for the I2C_START, I2C_STOP, I2C_READ, I2C_WRITE and I2C_POLL functions until another USE I2C is encountered. Software functions are generated unless the FORCE_HW is specified. The SLAVE mode should only be used with the built-in SSP. The functions created with this directive are exported when using multiple compilation units. To access the correct function use the stream identifier.

Examples:

```c
#use I2C(master, sda=PIN_B0, scl=PIN_B1)

#use I2C(slave, sda=PIN_C4, scl=PIN_C3
    address=0xa0, FORCE_HW)

#use I2C(master, scl=PIN_B0, sda=PIN_B1, fast=450000)
    //sets the target speed to 450 KBSP
```

Example Files:

`ex_extee.c` with `16c74.h`

#use profile()

Syntax:

```c
#use profile(options)
```

Elements:

`options` may be any of the following, comma separated:

<table>
<thead>
<tr>
<th>Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICD</td>
<td>Default – configures code profiler to use the ICD connection.</td>
</tr>
<tr>
<td>TIMER1</td>
<td>Optional. If specified, the code profiler run-time on the microcontroller will use the Timer1 peripheral as a timestamp for all profile events. If not specified the code profiler tool will use the PC clock, which may not be accurate for fast events.</td>
</tr>
<tr>
<td>BAUD=x</td>
<td>Optional. If specified, will use a different baud rate between the microcontroller and the code profiler tool. This may be required on slow microcontrollers to attempt to use a slower baud rate.</td>
</tr>
</tbody>
</table>

Purpose:

Tell the compiler to add the code profiler run-time in the microcontroller and configure the link and clock.
#use pwm()

Syntax: #use pwm (options)

Elements: options are separated by commas and may be:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWMx or CCPx</td>
<td>Selects the CCP to use, x being the module number to use.</td>
</tr>
<tr>
<td>OUTPUT=PIN_xx</td>
<td>Selects the PWM pin to use, pin must be one of the CCP pins. If device has remappable pins compiler will assign specified pin to specified CCP module. If CCP module not specified it will assign remappable pin to first available module.</td>
</tr>
<tr>
<td>TIMER=x</td>
<td>Selects timer to use with PWM module, default if not specified is timer 2.</td>
</tr>
<tr>
<td>FREQUENCY=x</td>
<td>Sets the period of PWM based off specified value, should not be used if PERIOD is already specified. If frequency can't be achieved exactly compiler will generate a message specifying the exact frequency and period of PWM. If neither FREQUENCY or PERIOD is specified, the period defaults to maximum possible period with maximum resolution and compiler will generate a message specifying the frequency and period of PWM, or if using same timer as previous stream instead of setting to maximum possible it will be set to the same as previous stream. If using same timer as previous stream and frequency is different compiler will generate an error.</td>
</tr>
<tr>
<td>PERIOD=x</td>
<td>Sets the period of PWM, should not be used if FREQUENCY is already specified. If period can't be achieved exactly compiler will generate a message specifying the exact period and frequency of PWM. If neither PERIOD or FREQUENCY is specified, the periodicity will default to maximum possible period with maximum resolution.</td>
</tr>
</tbody>
</table>
PreProcessor

| **BITS=x** | Sets the resolution of the PWM, if period or frequency is specified will adjust period to meet set resolution and will generate a message specifying the frequency and duty of PWM. If period or frequency not specified will set period to maximum possible for specified resolution and compiler will generate a message specifying the frequency and period of PWM, unless using same timer as previous then it will generate an error if resolution is different then previous stream. If not specified then frequency, period or previous stream using same timer sets the resolution. |
| **DUTY=x** | Selects the duty percentage of PWM, default if not specified is 50%. |
| **PWM_ON** | Initialize the PWM in the ON state, default state if pwm_on or pwm_off is not specified. |
| **PWM_OFF** | Initialize the PWM in the OFF state. |
| **STREAM=id** | Associates a stream identifier with the PWM signal. The identifier may be used in functions like pwm_set_duty_percent(). |

**Purpose:**

This directive tells the compiler to setup a PWM on the specified pin using the specified frequency, period, duty cycle and resolution. The #USE DELAY directive must appear before this directive can be used. This directive enables use of built-in functions such as set_pwm_duty_percent(), set_pwm_frequency(), set_pwm_period(), pwm_on() and pwm_off().

**Examples:**

None

**Also See:**

pwm_on(), pwm_off(), pwm_set_frequency(), pwm_set_duty_percent(), pwm_set_duty()
### #use rs232

**Syntax:**  
#USE RS232 (options)

**Elements:**  
*Options* are separated by commas and may be:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td><strong>CTS_LEVEL=x</strong></td>
<td>Specifies the active level of the CTS pin, HIGH is active high and LOW is active low. Default to LOW if not specified.</td>
</tr>
<tr>
<td><strong>FLOW_CONTROL_MODE</strong></td>
<td>Specifies how the RTS pin is used. For FLOW_CONTROL_MODE the RTS pin is driven to the active level when ready to receive data. Defaults to FLOW_CONTROL_MODE when neither FLOW_CONTROL_MODE or SIMPLEX_MODE is specified. If RTS pin is not specified then this option is not used.</td>
</tr>
<tr>
<td><strong>SIMPLEX_MODE</strong></td>
<td>Specifies how the RTS pin is used. For SIMPLEX_MODE the RTS pin is driven to the active level when it has data to send. Defaults to FLOW_CONTROL_MODE when neither FLOW_CONTROL_MODE or SIMPLEX_MODE is specified. If RTS pin is not specified then this option is not used.</td>
</tr>
</tbody>
</table>

This directive tells the compiler the baud rate and pins used for serial I/O. This directive takes effect until another RS232 directive is encountered. The #USE DELAY directive must appear before this directive can be used. This directive enables use of built-in functions such as GETC, PUTC, and PRINTF. The functions created with this directive are exported when using multiple compilation units. To access the correct function use the stream identifier.

**Purpose:**

When using parts with built-in SCI and the SCI pins are specified, the SCI will be used. If a baud rate cannot be achieved within 3% of the desired value using the current clock rate, an error will be generated. The definition of the RS232_ERRORS is as follows:

- No UART:
  - Bit 7 is 9th bit for 9 bit data mode (get and put).
Bit 6 set to one indicates a put failed in float high mode.

With a UART:
- Used only by get:
- Copy of RCSTA register except:
  - Bit 0 is used to indicate a parity error.

The definition of the RS232_BUFFER_ERRORS variable is as follows:
- Bit 0 UART Receive overrun error occurred.
- Bit 1 Receive Buffer overflowed.
- Bit 2 Transmit Buffer overflowed.

Warning:
The PIC UART will shut down on overflow (3 characters received by the hardware with a GETC() call). The "ERRORS" option prevents the shutdown by detecting the condition and resetting the UART.

Examples:
```
#use rs232(baud=9600, xmit=PIN_A2, rcv=PIN_A3)
```

Example Files: `ex_cust.c`

Also See:

---

**#use rtos**

(The RTOS is only included with the PCW and PCWH packages.)

The CCS Real Time Operating System (RTOS) allows a PIC micro controller to run regularly scheduled tasks without the need for interrupts. This is accomplished by a function (RTOS_RUN()) that acts as a dispatcher. When a task is scheduled to run, the dispatch function gives control of the processor to that task. When the task is done executing or does not need the processor anymore, control of the processor is returned to the dispatch function which then will give control of the processor to the next task that is scheduled to execute at the appropriate time. This process is called cooperative multi-tasking.

Syntax:
```
#USE RTOS (options)
```

Elements:
- Options are separated by comma and may be:
  - `timer=X` Where x is 0-4 specifying the timer used by the RTOS.
  - `minor_cycle=time` Where time is a number followed by s, ms,
This directive tells the compiler which timer on the PIC to use for monitoring and when to grant control to a task. Changes to the specified timer's prescaler will effect the rate at which tasks are executed.

This directive can also be used to specify the longest time that a task will ever take to execute with the minor_cycle option. This simply forces all task execution rates to be a multiple of the minor_cycle before the project will compile successfully. If the this option is not specified the compiler will use a minor_cycle value that is the smallest possible factor of the execution rates of the RTOS tasks.

If the statistics option is specified then the compiler will keep track of the minimum processor time taken by one execution of each task, the maximum processor time taken by one execution of each task, and the total processor time used by each task.

When linking multiple compilation units, this directive must appear exactly the same in each compilation unit.

**Examples:**

```
#use rtos(timer=0, minor_cycle=20ms)
```

**Also See:**

`#TASK`

---

### #use spi

**Syntax:**

```
#USE SPI (options)
```

**Options** are separated by commas and may be:

- **MASTER**: Set the device as the master. (default)
- **SLAVE**: Set the device as the slave.
- **BAUD=n**: Target bits per second, default is as fast as possible.
- **CLOCK_HIGH=n**: High time of clock in us (not needed if BAUD= is used). (default=0)
- **CLOCK_LOW=n**: Low time of clock in us (not needed if BAUD= is used). (default=0)

**Elements:**

- **MASTER**: Set the device as the master. (default)
- **SLAVE**: Set the device as the slave.
- **BAUD=n**: Target bits per second, default is as fast as possible.
- **CLOCK_HIGH=n**: High time of clock in us (not needed if BAUD= is used). (default=0)
- **CLOCK_LOW=n**: Low time of clock in us (not needed if BAUD= is used). (default=0)

</tr>
</tbody>
</table>

### Purpose:

The SPI library contains functions to implement an SPI bus. After setting all of the proper parameters in #USE SPI, the spi_xfer() function can be used to both transfer and receive data on the SPI bus.

The SPI1 and SPI2 options will use the SPI hardware onboard the PIC. The most common pins present on hardware SPI are: DI, DO, and CLK. These pins don’t need to be assigned values through the options; the compiler will automatically assign hardware-specific values to these pins. Consult your PIC’s data sheet as to where the pins for hardware SPI are. If hardware SPI is not used, then software SPI will be used. Software SPI is much slower than hardware SPI, but software SPI can use any pins to transfer and receive data other than just the pins tied to the PIC’s hardware SPI pins.
The MODE option is more or less a quick way to specify how the stream is going to sample data. MODE=0 sets IDLE=0 and SAMPLE_RISE. MODE=1 sets IDLE=0 and SAMPLE_FALL. MODE=2 sets IDLE=1 and SAMPLE_FALL. MODE=3 sets IDLE=1 and SAMPLE_RISE. There are only these 4 MODEs.

SPI cannot use the same pins for DI and DO. If needed, specify two streams: one to send data and another to receive data.

The pins must be specified with DI, DO, CLK or SPIx, all other options are defaulted as indicated above.

```c
#use spi(DI=PIN_B1, DO=PIN_B0, CLK=PIN_B2, ENABLE=PIN_B4, BITS=16)
// uses software SPI
```

**Examples:**

```c
#use spi(FORCE_HW, BITS=16, stream=SPI_STREAM)
// uses hardware SPI and gives this stream the name SPI_STREAM
```

**Example Files:**

None

**Also See:**

spi_xfer()
#use timer

## Syntax:

`#USE TIMER (options)`

<table>
<thead>
<tr>
<th>Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMER=x</td>
<td>Sets the timer to use as the tick timer. x is a valid timer that the PIC has. Default value is 1 for Timer 1.</td>
</tr>
<tr>
<td>TICK=xx</td>
<td>Sets the desired time for 1 tick. xx can be used with ns(nanoseconds), us (microseconds), ms (milliseconds), or s (seconds). If the desired tick time can't be achieved it will set the time to closest achievable time and will generate a warning specifying the exact tick time. The default value is 1us.</td>
</tr>
<tr>
<td>BITS=x</td>
<td>Sets the variable size used by the get_ticks() and set_ticks() functions for returning and setting the tick time. x can be 8 for 8 bits, 16 for 16 bits or 32 for 32 bits. The default is 32 for 32 bits.</td>
</tr>
<tr>
<td>ISR</td>
<td>Uses the timer's interrupt to increment the upper bits of the tick timer. This mode requires the the global interrupt be enabled in the main program.</td>
</tr>
<tr>
<td>NOISR</td>
<td>The get_ticks() function increments the upper bits of the tick timer. This requires that the get_ticks() function be called more often then the timer's overflow rate. NOISR is the default mode of operation.</td>
</tr>
<tr>
<td>STREAM=id</td>
<td>Associates a stream identifier with the tick timer. The identifier may be used in functions like get_ticks().</td>
</tr>
<tr>
<td>DEFINE=id</td>
<td>Creates a define named id which specifies the number of ticks that will occur in one second. Default define name if not specified is TICKS_PER_SECOND. Define name must start with an ASCII letter 'A' to 'Z', an ASCII letter 'a' to 'z' or an ASCII underscore ('_').</td>
</tr>
<tr>
<td>COUNTER or COUNTER=x</td>
<td>Sets up specified timer as a counter instead of timer. x specifies the prescaller to setup counter with, default is1 if x is not specified</td>
</tr>
</tbody>
</table>
specified. The function `get_ticks()` will return the current count and the function `set_ticks()` can be used to set count to a specific starting value or to clear counter.

**Purpose:**
This directive creates a tick timer using one of the PIC's timers. The tick timer is initialized to zero at program start. This directive also creates the define `TICKS_PER_SECOND` as a floating point number, which specifies that number of ticks that will occur in one second.

**Examples:**

```c
#USE TIMER(TIMER=1,TICK=1ms,BITS=16,NOISR)

unsigned int16 tick_difference(unsigned int16 current, unsigned int16 previous) {
    return(current - previous);
}

void main(void) {
    unsigned int16 current_tick, previous_tick;
    current_tick = previous_tick = get_ticks();
    while(TRUE) {
        current_tick = get_ticks();
        if(tick_difference(current_tick, previous_tick) > 1000) {
            output_toggle(PIN_B0);
            previous_tick = current_tick;
        }
    }
}
```

**Example Files:** None

**Also See:** `get_ticks()`, `set_ticks()`

---

### #use touchpad

**Syntax:**

`#USE TOUCHPAD (options)`

**Elements:**

- `RANGE=x`
  
  Sets the oscillator charge/discharge current range. If `x` is L, current is nominally 0.1 microamps. If `x` is M, current is nominally 1.2 microamps. If `x` is H, current is nominally 18 microamps. Default value is H (18 microamps).

- `THRESHOLD=x`
  
  `x` is a number between 1-100 and represents the percent reduction in the nominal frequency that will generate a valid key press in software. Default value is 6%.
**SCANTIME=xxMS**
xx is the number of milliseconds used by the microprocessor to scan for one key press. If utilizing multiple touch pads, each pad will use xx milliseconds to scan for one key press. Default is 32ms.

**PIN=char**
If a valid key press is determined on “PIN”, the software will return the character “char” in the function touchpad_getc(). (Example: PIN_B0='A')

**SOURCETIME=xxus** (CTMU only)
x is the number of microseconds each pin is sampled for by ADC during each scan time period. Default is 10us.

**Purpose:**
This directive will tell the compiler to initialize and activate the Capacitive Sensing Module (CSM) or Charge Time Measurement Unit (CTMU) on the microcontroller. The compiler requires use of the TIMER0 and TIMER1 modules for CSM and Timer1 ADC modules for CTMU, and global interrupts must still be activated in the main program in order for the CSM or CTMU to begin normal operation. For most applications, a higher RANGE, lower THRESHOLD, and higher SCANTIME will result better key press detection. Multiple PIN's may be declared in “options”, but they must be valid pins used by the CSM or CTMU. The user may also generate a TIMER0 ISR with TIMER0's interrupt occurring every SCANTIME milliseconds. In this case, the CSM's or CTMU's ISR will be executed first.

**Examples:**
```
#USE TOUCHPAD (THRESHOLD=5, PIN_D5='5', PIN_B0='C')
void main(void){
    char c;
    enable_interrupts(GLOBAL);

    while(1){
        c = TOUCHPAD_GETC(); //will wait until a pin is detected
                                //if PIN_B0 is pressed, c will have 'C'
                                //if PIN_D5 is pressed, c will have '5'
    }
}
```

**Example Files:** None

**Also See:** touchpad_state(), touchpad_getc(), touchpad_hit()
#warning

Syntax:  

```
#WARNING text
```

Elements:  

```
text
```

is optional and may be any text

Purpose:  

Forces the compiler to generate a warning at the location this directive appears in the file. The text may include macros that will be expanded for the display. This may be used to see the macro expansion. The command may also be used to alert the user to an invalid compile time situation.

To prevent the warning from being counted as a warning, use this syntax:  

```
#warning/information text
```

Examples:  

```
#if BUFFER_SIZE < 32
#warning Buffer Overflow may occur
#endif
```

Example Files:  

ex_psp.c

Also See:  

#ERROR

#word

Syntax:  

```
#WORD id = x
```

Elements:  

```
id
```

is a valid C identifier,

```
x
```

is a C variable or a constant

If the id is already known as a C variable then this will locate the variable at address x. In this case the variable type does not change from the original definition. If the id is not known a new C variable is created and placed at address x with the type int16

Purpose:  

Warning: In both cases memory at x is not exclusive to this variable. Other variables may be located at the same location. In fact when x is a variable, then id and x share the same memory location.

Examples:  

```
#define data = 0x0800

struct {
  int lowerByte : 8;
```
### #zero_ram

**Syntax:**

```
#ZERO_RAM
```

**Elements:**

None

**Purpose:**

This directive zero's out all of the internal registers that may be used to hold variables before program execution begins.

**Examples:**

```
#define zero_ram
void main() {
}
```

**Example Files:**

`ex_cust.c`

**Also See:**

None
The CCS compiler provides a lot of built-in functions to access and use the PIC microcontroller's peripherals. This makes it very easy for the users to configure and use the peripherals without going into in depth details of the registers associated with the functionality. The functions categorized by the peripherals associated with them are listed on the next page. Click on the function name to get a complete description and parameter and return value descriptions.

### abs( )

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>value = abs(x)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>x is a signed 8, 16, or 32 bit int or a float</td>
</tr>
<tr>
<td>Returns:</td>
<td>Same type as the parameter.</td>
</tr>
<tr>
<td>Function:</td>
<td>Computes the absolute value of a number.</td>

<td>signed int target, actual; ... error = abs(target-actual);</td>
</tr>
<tr>
<td>Example Files:</td>
<td>None</td>
</tr>
<tr>
<td>Also See:</td>
<td>labs()</td>
</tr>
</tbody>
</table>
sin( )  cos( )  tan( )  asin( )  acos()  atan()  sinh()  cosh()  tanh()  atan2()

Syntax:

val = sin (rad)
val = cos (rad)
val = tan (rad)
rad = asin (val)
rad1 = acos (val)
rad = atan (val)
rad2=atan2(val, val)
result=sinh(value)
result=cosh(value)
result=tanh(value)

Parameters:

rad is a float representing an angle in Radians -2pi to 2pi.
val is a float with the range -1.0 to 1.0.
Value is a float

Returns:

rad1 is a float representing an angle in Radians 0 to pi
rad2 is a float representing an angle in Radians -pi/2 to pi/2
Result is a float

Function:

These functions perform basic Trigonometric functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sin</td>
<td>returns the sine value of the parameter (measured in radians)</td>
</tr>
<tr>
<td>cos</td>
<td>returns the cosine value of the parameter (measured in radians)</td>
</tr>
<tr>
<td>tan</td>
<td>returns the tangent value of the parameter (measured in radians)</td>
</tr>
<tr>
<td>asin</td>
<td>returns the arc sine value in the range [-pi/2,+pi/2] radians</td>
</tr>
<tr>
<td>acos</td>
<td>returns the arc cosine value in the range [0,pi] radians</td>
</tr>
<tr>
<td>atan</td>
<td>returns the arc tangent value in the range [-pi/2,+pi/2] radians</td>
</tr>
<tr>
<td>atan2</td>
<td>returns the arc tangent of y/x in the range [-pi,+pi] radians</td>
</tr>
<tr>
<td>sinh</td>
<td>returns the hyperbolic sine of x</td>
</tr>
<tr>
<td>cosh</td>
<td>returns the hyperbolic cosine of x</td>
</tr>
<tr>
<td>tanh</td>
<td>returns the hyperbolic tangent of x</td>
</tr>
</tbody>
</table>

Note on error handling:
If "errno.h" is included then the domain and range errors are stored in the errno variable. The user can check the errno to see if an error has occurred
and print the error using the perror function.

Domain error occurs in the following cases:
asin: when the argument not in the range[-1,+1]
acos: when the argument not in the range[-1,+1]
atan2: when both arguments are zero

Range error occur in the following cases:
cosh: when the argument is too large
sinh: when the argument is too large

Availability: All devices
Requires: #INCLUDE <math.h>

Examples:
float phase;
// Output one sine wave
for(phase=0; phase<2*3.141596; phase+=0.01)
  set_analog_voltage( sin(phase)+1 );

Example Files: ex_tank.c

Also See: log(), log10(), exp(), pow(), sqrt()

---

**adc_done( )**

Syntax: value = adc_done();

Parameters: None

*channel* is an optional parameter for specifying the channel to check if the conversion is done. If not specified will use channel specified in the last call to set_adc_channel(), read_adc() or adc_done(). Only available for dsPIC33EPxxGSxxx family.

Returns: A short int. TRUE if the A/D converter is done with conversion, FALSE if it is still busy.

Function: Can be polled to determine if the A/D has valid data.

Availability: Only available on devices with built in analog to digital converters

Requires: None

Examples: int16 value;
  setup_adc_ports(sAN0|sAN1, VSS_VDD);
```c
setup_adc(ADC_CLOCK_DIV_4|ADC_TAD_MUL_8);
set_adc_channel(0);
read_adc(ADC_START_ONLY);

int1 done = adc_done();
while(!done) {
    done = adc_done();
}

value = read_adc(ADC_READ_ONLY);
printf("A/C value = \$LX\n\r", value);
```

**Example Files:** None

**Also See:** setup_adc(), set_adc_channel(), setup_adc_ports(), read_adc(), ADC Overview

---

### adc_read()

**Syntax:**

```c
result=adc_read(register)
```

**Parameters:**

- **register** - ADC register to read:
  - ADC_RESULT
  - ADC_ACCUMULATOR
  - ADC_FILTER

**Returns:**

int8 or in16 read from the specified register. Return size depends on which register is being read. For example, ADC_RESULT register is 16 bits and ADC_COUNT register is 8-bits.

**Function:**

Reads one of the Analog-to-Digital Converter with Computation (ADC2) Module registers

**Availability:**

All devices with an ADC2 Module

**Requires:**

Constants defined in the device’s .h file

**Examples:**

```c
FilteredResult=adc_read(ADC_FILTER);
```

**Also See:** ADC Overview, setup_adc(), setup_adc_ports(), set_adc_channel(), read_adc(), #DEVICE, adc_write(), adc_status(), set_adc_trigger()
# adc_status()

**Syntax:**

```plaintext
status = adc_status()
```

**Parameters:**
None

**Returns:**
int8 value of the ADSTAT register

**Function:**
Read the current value of the ADSTAT register of the Analog-to-Digital Converter with Computation (ADC2) Module.

**Availability:**
All devices with an ADC2 Module

**Requires:**
Nothing

**Examples:**

```plaintext
while((adc_status() & ADC_UPDATING)==0);
```

**Also See:**
ADC Overview, setup_adc(), setup_adc_ports(), set_adc_channel(), read_adc(), #DEVICE, adc_read(), adc_write(), set_adc_trigger()

---

# adc_write()

**Syntax:**

```plaintext
adc_write(register, value)
```

**Parameters:**
- `register` - ADC register to write:
  - ADC_REPEAT
  - ADC_SET_POINT
  - ADC_LOWER_THRESHOLD
  - ADC_UPPER_THRESHOLD

**Returns:**
undefined

**Function:**
Write one of the Analog-to-Digital Converter with Computation (ADC2) Module registers.

**Availability:**
All devices with an ADC2 Module

**Requires:**
Constants defined in the device’s .h file

**Examples:**

```plaintext
adc_write(ADC_SET_POINT, 300);
```

**Also See:**
ADC Overview, setup_adc(), setup_adc_ports(), set_adc_channel(), read_adc(), #DEVICE, adc_read(), adc_status(), set_adc_trigger()
## assert( )

### Syntax:
```
assert (condition);
```

### Parameters:
- `condition` is any relational expression

### Returns:
Nothing

### Function:
This function tests the condition and if FALSE will generate an error message on STDERR (by default the first USE RS232 in the program). The error message will include the file and line of the assert(). No code is generated for the assert() if you #define NODEBUG. In this way you may include asserts in your code for testing and quickly eliminate them from the final program.

### Availability:
All devices

### Requires:
assert.h and #USE RS232

```c
assert( number_of_entries<TABLE_SIZE );
```

### Examples:
```c
// If number_of_entries is >= TABLE_SIZE then
// the following is output at the RS232:
// Assertion failed, file myfile.c, line 56
```

### Example Files:
None

### Also See:
#USE RS232, RS232 I/O Overview

## atofe

### Syntax:
```
atoe(string);
```

### Parameters:
- `string` is a pointer to a null terminated string of characters.

### Returns:
Result is a floating point number

### Function:
Converts the string passed to the function into a floating point representation. If the result cannot be represented, the behavior is undefined. This function also handles E format numbers.

### Availability:
All devices
### atof()

**Syntax:**

\[
result = atof(\textit{string})
\]

**Parameters:**

\textit{string} is a pointer to a null terminated string of characters.

**Returns:**

Result is a floating point number

**Function:**

Converts the string passed to the function into a floating point representation. If the result cannot be represented, the behavior is undefined.

**Availability:**

All devices

**Requires:**

`#include <stdlib.h>`

```c
char string [10];
float32 x;
```

**Examples:**

```c
strcpy (string, "123.456");
x = atof(string);
// x is now 123.456
```

**Example Files:**

`ex_tank.c`

**Also See:**

`atoi(), atol(), atoi32(), printf()`
# pin_select()

**Syntax:**

```c
pin_select(peripheral_pin, pin, [unlock],[lock])
```

**Parameters:**

- `peripheral_pin` – a constant string specifying which peripheral pin to map the specified pin to. Refer to `#pin_select` for all available strings. Using “NULL” for the peripheral_pin parameter will unassign the output peripheral pin that is currently assigned to the pin passed for the pin parameter.

- `pin` – the pin to map to the specified peripheral pin. Refer to device’s header file for pin defines. If the peripheral_pin parameter is an input, passing FALSE for the pin parameter will unassign the pin that is currently assigned to that peripheral pin.

- `unlock` – optional parameter specifying whether to perform an unlock sequence before writing the RPINRx or RPORx register determined by peripheral_pin and pin options. Default is TRUE if not specified. The unlock sequence must be performed to allow writes to the RPINRx and RPORx registers. This option allows calling `pin_select()` multiple times without performing an unlock sequence each time.

- `lock` – optional parameter specifying whether to perform a lock sequence after writing the RPINRx or RPORx registers. Default is TRUE if not specified. Although not necessary it is a good idea to lock the RPINRx and RPORx registers from writes after all pins have been mapped. This option allows calling `pin_select()` multiple times without performing a lock sequence each time.

**Returns:**

Nothing.

**Availability:**

On device with remappable peripheral pins.

**Requires:**

Pin defines in device’s header file.

**Examples:**

```c
pin_select(“U2TX”,PIN_B0);
//Maps PIN_B0 to U2TX //peripheral pin, performs unlock //and lock sequences.

pin_select(“U2TX”,PIN_B0,TRUE,FALSE);
//Maps PIN_B0 to U2TX //peripheral pin and performs //unlock sequence.

pin_select(“U2RX”,PIN_B1,FALSE,TRUE);
```
//Maps PIN_B1 to U2RX //peripheral pin and performs lock //sequence.

Example Files: None.

Also See: #pin_select

### atoi()  atol()  atoi32()

**Syntax:**

```c
ivalue = atoi(string)
or
lvalue = atol(string)
or
i32value = atoi32(string)
```

**Parameters:**

`string` is a pointer to a null terminated string of characters.

**Returns:**

- `ivalue` is an 8 bit int.
- `lvalue` is a 16 bit int.
- `i32value` is a 32 bit int.

**Function:**

Converts the string passed to the function into an int representation. Accepts both decimal and hexadecimal argument. If the result cannot be represented, the behavior is undefined.

**Availability:**

All devices

**Requires:**

`#include <stdlib.h>`

```c
char string[10];
int x;
```

**Examples:**

```c
strcpy(string,"123");
x = atoi(string);
// x is now 123
```

**Example Files:**

`input.c`

**Also See:**

`printf()`
### at_clear_interrupts( )

**Syntax:**

```c
at_clear_interrupts(interrupts);
```

**Parameters:**

- `interrupts` - an 8-bit constant specifying which AT interrupts to disable. The constants are defined in the device's header file as:
  - `AT_PHASE_INTERRUPT`
  - `AT_MISSING_PULSE_INTERRUPT`
  - `AT_PERIOD_INTERRUPT`
  - `AT_CC3_INTERRUPT`
  - `AT_CC2_INTERRUPT`
  - `AT_CC1_INTERRUPT`

**Returns:**

Nothing

**Function:**

To disable the Angular Timer interrupt flags. More than one interrupt can be cleared at a time by or'ing multiple constants together in a single call, or calling function multiple times for each interrupt to clear.

**Availability:**

All devices with an AT module.

**Requires:**

Constants defined in the device's header file

```c
#INT-AT1
void1_isr(void)
{
    if(at_interrupt_active(AT_PERIOD_INTERRUPT))
    {
        handle_period_interrupt();
        at_clear_interrupts(AT_PERIOD_INTERRUPT);
    }
    if(at_interrupt_active(AT_PHASE_INTERRUPT))
    {
        handle_phase_interrupt();
        at_clear_interrupts(AT_PHASE_INTERRUPT);
    }
}
```

**Examples:**

None

**Example Files:**

None

**Also See:**

- `at_set_resolution()`, `at_get_resolution()`,
- `at_set_missing_pulse_delay()`, `at_get_missing_pulse_delay()`,
- `at_set_period()`, `at_get_phase_counter()`, `at_set_set_point()`,
- `at_get_set_point()`, `at_get_set_point_error()`, `at_enable_interrupts()`,
- `at_disable_interrupts()`, `at_interrupt_active()`, `at_setup_cc()`,
- `at_set_compare_time()`, `at_get_capture()`, `at_get_status()`, `setup_at()`
at_disable_interrupts( )

Syntax: at_disable_interrupts(interrupts);

Parameters: interrupts - an 8-bit constant specifying which AT interrupts to disable. The constants are defined in the device's header file as:
- AT_PHASE_INTERRUPT
- AT_MISSING_PULSE_INTERRUPT
- AT_PERIOD_INTERRUPT
- AT_CC3_INTERRUPT
- AT_CC2_INTERRUPT
- AT_CC1_INTERRUPT

Returns: Nothing

Function: To disable the Angular Timer interrupts. More than one interrupt can be disabled at a time by or'ing multiple constants together in a single call, or calling function multiple times for each interrupt to be disabled.

Availability: All devices with an AT module.

Requires: Constants defined in the device's header file

Examples: at_disable_interrupts(AT_PHASE_INTERRUPT);
          at_disable_interrupts(AT_PERIOD_INTERRUPT|AT_CC1_INTERRUPT);

Example Files: None

Also See: at_set_resolution(), at_get_resolution(), at_set_missing_pulse_delay(), at_get_missing_pulse_delay(), at_get_period(), at_get_phase_counter(), at_set_set_point(), at_set_point(), at_get_set_point_error(), at_enable_interrupts(), at_clear_interrupts(), at_interrupt_active(), at_setup_cc(), at_set_compare_time(), at_get_capture(), at_get_status(), setup_at()

at_enable_interrupts( )

Syntax: at_enable_interrupts(interrupts);

Parameters: interrupts - an 8-bit constant specifying which AT interrupts to enable. The constants are defined in the device's header file as:
Returns: Nothing

Function: To enable the Angular Timer interrupts. More than one interrupt can be enabled at a time by or'ing multiple constants together in a single call, or calling function multiple times for each interrupt to be enabled.

Availability: All devices with an AT module.

Requires: Constants defined in the device's header file

Examples:

```c
at_enable_interrupts(AT_PHASE_INTERRUPT);
at_enable_interrupts(AT_PERIOD_INTERRUPT|AT_CC1_INTERRUPT);
```

Example Files: None

Also See: setup_at(), at_set_resolution(), at_get_resolution(),

at_clear_interrupts(), at_interrupt_active(), at_setup_cc(),
at_set_compare_time(), at_get_capture(), at_get_status()

---

**at_get_capture()**

Syntax: `result=at_get_capture(which);`

Parameters: `which` - an 8-bit constant specifying which AT Capture/Compare module to get the capture time from, can be 1, 2 or 3.

Returns: A 16-bit integer

Function: To get one of the Angular Timer Capture/Compare modules capture time.

Availability: All devices with an AT module.

### at_get_period()

**Parameters:** None.

**Returns:** A 16-bit integer. The MSB of the returned value specifies whether the period counter rolled over one or more times. 1 - counter rolled over at least once, 0 - value returned is valid.

**Function:** To get Angular Timer Measured Period

**Availability:** All devices with an AT module.

**Requires:** Nothing

**Examples:**

```
result = at_get_period();
```

**Example Files:** None

**Also See:**

- at_set_resolution(), at_get_resolution(),
- at_set_missing_pulse_delay(), at_get_missing_pulse_delay(),
- at_get_phase_counter(), at_set_set_point(), at_get_set_point(),

- at_setup_cc(), at_set_compare_time(), at_get_capture(),
- at_get_status(), setup_at()

### at_get_phase_counter()

**Syntax:**

```
result = at_get_phase_counter();
```

**Parameters:** None.

**Returns:** A 16-bit integer.

**Function:** To get the Angular Timer Phase Counter

**Availability:** All devices with an AT module.

**Requires:** Nothing

**Examples:**

```
result = at_get_phase_counter();
```

**Example Files:** None

**Also See:**

- at_set_resolution(), at_get_resolution(),
at_get_resolution( )

Syntax:  
result = at_get_resolution();

Parameters:  
None

Returns:  
A 16-bit integer

Function:  
To setup the Angular Timer Resolution

Availability:  
All devices with an AT module.

Requires:  
Nothing

Examples:  
result = at_get_resolution();

Example Files:  
None

Also See:  
at_set_resolution(), at_set_missing_pulse_delay(),
at_get_missing_pulse_delay(), at_get_period(),

at_setup_cc(), at_set_compare_time(), at_get_capture(),
at_get_status(), setup_at()

at_get_set_point( )

Syntax:  
result = at_get_set_point();

Parameters:  
None

Returns:  
A 16-bit integer

Function:  
To get the Angular Timer Set Point

Also See:  
at_set_resolution(), at_set_missing_pulse_delay(),
at_get_missing_pulse_delay(), at_get_period(),
at_get_phase_counter(), at_set_set_point(), at_get_set_point(),

at_disable_interrupts(), at_clear_interrupts(), at_interrupt_active(),
at_setup_cc(), at_set_compare_time(), at_get_capture(),
at_get_status(), setup_at()
### at_get_set_point_error( )

#### Syntax:
```
result = at_get_set_point_error();
```

#### Parameters:
None

#### Returns:
A 16-bit integer

#### Function:
To get the Angular Timer Set Point Error, the error of the measured period value compared to the threshold setting.

#### Availability:
All devices with an AT module.

#### Requires:
Nothing

#### Examples:
```
result = at_get_set_point_error();
```

#### Example Files:
None

#### Also See:
- `at_set_resolution()`, `at_get_resolution()`,
- `at_set_missing_pulse_delay()`, `at_get_missing_pulse_delay()`,
- `at_get_period()`, `at_get_phase_counter()`, `at_set_set_point()`,
- `at_get_set_point_error()`, `at_enable_interrupts()`,
- `at_disable_interrupts()`, `at_clear_interrupts()`, `at_interrupt_active()`,
- `at_setup_cc()`, `at_set_compare_time()`, `at_get_capture()`,
- `at_get_status()`, `setup_at()`
at_get_status( )

Syntax: result=at_get_status();

Parameters: None

Returns: An 8-bit integer. The possible results are defined in the device's header file as:
- AT_STATUS_PERIOD_AND_PHASE_VALID
- AT_STATUS_PERIOD_LESS_THAN_PREVIOUS

Function: To get the status of the Angular Timer module.

Availability: All devices with an AT module.

Requires: Nothing

Examples:
```c
if((at_get_status()&AT_STATUS_PERIOD_AND_PHASE_VALID)==
    AT_STATUS_PERIOD_AND_PHASE_VALID)
{
    Period=at_get_period();
    Phase=at_get_phase();
}
```

Example Files: None

Also See: at_set_resolution(), at_get_resolution(), at_set_missing_pulse_delay(), at_get_missing_pulse_delay(), at_get_period(), at_get_phase_counter(), at_set_set_point(), at_get_set_point(), at_set_missing_pulse_delay(), at_get_missing_pulse_delay(), at_get_period(), at_get_phase_counter(), at_set_set_point(), at_get_set_point(), at_enable_interrupts(), at_disable_interrupts(), at_clear_interrupts(), at_interrupt_active(), at_setup_cc(), at_set_compare_time(), at_get_capture(), setup_at()

at_interrupt_active( )

Syntax: result=at_interrupt_active(interrupt);

Parameters: interrupts - an 8-bit constant specifying which AT interrupts to check if its flag is set. The constants are defined in the device's header file as:
- AT_PHASE_INTERRUPT
- AT_MISSING_PULSE_INTERRUPT

## at_set_compare_time()

### Syntax:

```c
at_set_compare_time(which, compare_time);
```

### Parameters:

- **which** - an 8-bit constant specifying which AT Capture/Compare module to set the compare time for, can be 1, 2, or 3.

### Returns:

TRUE if the specified AT interrupt's flag is set, interrupt is active, or FALSE if the flag is clear, interrupt is not active.

### Function:

To check if the specified Angular Timer interrupt flag is set.

### Availability:

All devices with an AT module.

### Requires:

Constants defined in the device's header file.

### Examples:

```c
#INT-AT1
void1_isr(void)
{
    if(at_interrupt_active(AT_PERIOD_INTERRUPT))
    {
        handle_period_interrupt();
        at_clear_interrupts(AT_PERIOD_INTERRUPT);
    }
    if(at_interrupt_active(AT_PHASE_INTERRUPT))
    {
        handle_phase_interrupt();
        at_clear_interrupts(AT_PHASE_INTERRUPT);
    }
}
```

### Example Files:

None

### Also See:

## Built-in Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>compare_time</strong></td>
<td>a 16-bit constant or variable specifying the value to trigger an interrupt/output pulse.</td>
</tr>
</tbody>
</table>

### Returns:
Nothing

### Function:
To set one of the Angular Timer Capture/Compare module’s compare time.

### Availability:
All devices with an AT module.

### Requires:
Constants defined in the device’s header file

### Examples:
- `at_set_compare_time(1,0x1FF);`
- `at_set_compare_time(3,compare_time);`

### Example Files:
None

### Also See:
- `at_set_resolution()`, `at_get_resolution()`,
at_set_resolution( )

Syntax:     at_set_resolution(resolution);

Parameters: resolution - a 16-bit constant or variable to set the resolution.

Returns:    Nothing

Function:   To setup the Angular Timer Resolution

Availability: All devices with an AT module.

Requires:   Nothing

Examples:

Example Files: None

Also See:

at_set_resolution(), at_set_missing_pulse_delay(), at_get_period(), at_get_missing_pulse_delay(), at_get_phase_counter(), at_set_set_point(), at_get_set_point(), at_get_set_point_error(), at_enable_interruptions(), at_disable_interruptions(), at_clear_interruptions(), at_interrupt_active(), at_setup_cc(), at_set_compare_time(), at_get_capture(), at_get_status(), setup_at()

at_set_set_point( )

Syntax:     at_set_set_point(set_point);

Parameters: set_point - a 16-bit constant or variable to set the set point. The set point determines the threshold setting that the period is compared against for error calculation.

Also See:

at_get_resolution(), at_set_missing_pulse_delay(), at_get_period(), at_get_missing_pulse_delay(), at_get_phase_counter(), at_set_set_point(), at_get_set_point(), at_get_set_point_error(), at_enable_interruptions(), at_disable_interruptions(), at_clear_interruptions(), at_interrupt_active(), at_setup_cc(), at_set_compare_time(), at_get_capture(), at_get_status(), setup_at()
## at_setup_cc()

**Syntax:**

```c
at_setup_cc(which, settings);
```

**Parameters:**

- `which` - an 8-bit constant specifying which AT Capture/Compare to setup, can be 1, 2 or 3.

- `settings` - a 16-bit constant specifying how to setup the specified AT Capture/Compare module. See the device's header file for all options. Some of the typical options include:
  - `AT_CC_ENABLED`
  - `AT_CC_DISABLED`
  - `AT_CC_CAPTURE_MODE`
  - `AT_CCCOMPARE_MODE`
  - `AT_CAPTURE_FALLING_EDGE`
  - `AT_CAPTURE_RISING_EDGE`

**Returns:**

Nothing

**Function:**

To setup one of the Angular Timer Capture/Compare modules to the specified settings.

**Availability:**

All devices with an AT module.
CCS C Compiler

Requires: Constants defined in the device’s header file

```c
at_setup_cc(1, AT_CC_ENABLED | AT_CC_CAPTURE_MODE | AT_CAPTURE_FALLING_EDGE | AT_CAPTURE_INPUT_ATCAP);
```

Examples:

```c
at_setup_cc(2, AT_CC_ENABLED | AT_CC_CAPTURE_MODE | AT_CC_ACTIVE_HIGH);
```

Example Files: None

- `at_disable_interrupts()`, `at_clear_interrupts()`, `at_get_status()`, `setup_at()`

---

### bit_clear()

**Syntax:**

```
bit_clear(var, bit)
```

**Parameters:**

- `var` may be any bit variable (any lvalue)
- `bit` is a number 0-31 representing a bit number, 0 is the least significant bit.

**Returns:**

undefined

**Function:**

Simply clears the specified bit (0-7, 0-15 or 0-31) in the given variable. The least significant bit is 0. This function is similar to:

```c
var &= ~(1<<bit);
```

**Availability:**

All devices

**Requires:**

Nothing

```c
int x;
x=5;
```

**Examples:**

```
bit_clear(x, 2);
// x is now 1
```

**Example Files:**

- `ex_patg.c`

**Also See:**

- `bit_set()`, `bit_test()`

---

176
### bit_set( )

**Syntax:**  
\[
\text{bit\_set}(var, bit)
\]

**Parameters:**  
- `var` may be a 8, 16 or 32 bit variable (any lvalue)  
- `bit` is a number 0-31 representing a bit number, 0 is the least significant bit.

**Returns:**  
Undefined

**Function:**  
Sets the specified bit (0-7, 0-15 or 0-31) in the given variable. The least significant bit is 0. This function is the similar to: \( var \mid= (1\ll bit) \)

**Availability:**  
All devices

**Requires:**  
Nothing

**Examples:**

```c
int x;
x=5;
bit_set(x,3);
// x is now 13
```

**Example Files:**  
ex_patg.c

**Also See:**  
bit_clear(), bit_test()

---

### bit_test( )

**Syntax:**  
\[
\text{value} = \text{bit\_test}(var, bit)
\]

**Parameters:**  
- `var` may be a 8, 16 or 32 bit variable (any lvalue)  
- `bit` is a number 0-31 representing a bit number, 0 is the least significant bit.

**Returns:**  
0 or 1

**Function:**  
Tests the specified bit (0-7, 0-15 or 0-31) in the given variable. The least significant bit is 0. This function is much more efficient than, but otherwise similar to:  
\[
((var \& (1\ll bit)) \neq 0)
\]

**Availability:**  
All devices

**Requires:**  
Nothing
Examples:

```c
if( bit_test(x,3) || !bit_test (x,1) ){
    //either bit 3 is 1 or bit 1 is 0
}
```

```c
if(data!=0)
    for(i=31;!bit_test(data, i);i-- ) ;
// i now has the most significant bit in data
// that is set to a 1
```

Example Files:  

```
ex_patg.c
```

Also See:  

```
bit_clear(), bit_set()
```

---

**brownout_enable( )**

**Syntax:**  

```
brownout_enable (value)
```

**Parameters:**  

```
value – TRUE or FALSE
```

**Returns:**  

undefined

**Function:**  

Enable or disable the software controlled brownout. Brownout will cause the PIC to reset if the power voltage goes below a specific set-point.

**Availability:**  

This function is only available on PICs with a software controlled brownout. This may also require a specific configuration bit/fuse to be set for the brownout to be software controlled.

**Requires:**  

Nothing

**Examples:**  

```
brownout_enable(TRUE);
```

**Example Files:**  

None

Also See:  

```
restart_cause()
```

---

**bsearch( )**

**Syntax:**  

```
ip = bsearch (&key, base, num, width, compare)
```

**Parameters:**  

```
key: Object to search for
```

---
Built-in Functions

**bsearch**

- **base**: Pointer to array of search data
- **num**: Number of elements in search data
- **width**: Width of elements in search data
- **compare**: Function that compares two elements in search data

**Returns**: bsearch returns a pointer to an occurrence of key in the array pointed to by base. If key is not found, the function returns NULL. If the array is not in order or contains duplicate records with identical keys, the result is unpredictable.

**Function**: Performs a binary search of a sorted array

**Availability**: All devices

**Requires**: 

```
#include <stdlib.h>
```

**Examples**:

```c
int nums[5]={1,2,3,4,5};
int compar(const void *arg1,const void *arg2);

void main() {
    int *ip, key;
    key = 3;
    ip = bsearch(&key, nums, 5, sizeof(int), compar);
}

int compar(const void *arg1,const void *arg2) {
    if ( * (int *) arg1 < ( * (int *) arg2) return -1
    else if ( * (int *) arg1 == ( * (int *) arg2) return 0
    else return 1;
}
```

**Example Files**: None

**Also See**: `qsort()`, `calloc()`

---

### calloc()

**Syntax**: `ptr=calloc(nmem, size)`

**Parameters**: 

- **nmem** is an integer representing the number of member objects
- **size** is the number of bytes to be allocated for each one of them.

**Returns**: A pointer to the allocated memory, if any. Returns null otherwise.

**Function**: The calloc function allocates space for an array of nmem objects whose size is specified by size. The space is initialized to all bits zero.
Ceil( )

Syntax: \[ \text{result} = \text{ceil} ( \text{value} ) \]

Parameters: \( \text{value} \) is a float

Returns: A float

Function: Computes the smallest integer value greater than the argument. \( \text{CEIL}(12.67) \) is 13.00.

Availability: All devices

Requires: \#INCLUDE<math.h>

Examples:

// Calculate cost based on weight rounded up to the next pound
\text{cost} = \text{ceil}( \text{weight} ) * \text{DollarsPerPound};

Example Files: None

Also See: floor()
### clc2_setup_gate(gate, mode);
clc3_setup_gate(gate, mode);
clc4_setup_gate(gate, mode);

**Parameters:**
- **gate** – selects which data gate of the Configurable Logic Cell (CLC) module to setup, value can be 1 to 4.
- **mode** – the mode to setup the specified data gate of the CLC module into. The options are:
  - CLC_GATE_AND
  - CLC_GATE_NAND
  - CLC_GATE_NOR
  - CLC_GATE_OR
  - CLC_GATE_CLEAR
  - CLC_GATE_SET

**Returns:** Undefined

**Function:**
Sets the logic function performed on the inputs for the specified data gate.

**Availability:**
On devices with a CLC module.

**Returns:**
Undefined.

**Examples:**
clc1_setup_gate(1, CLC_GATE_AND);
clc1_setup_gate(2, CLC_GATE_NAND);
clc1_setup_gate(3, CLC_GATE_CLEAR);
clc1_setup_gate(4, CLC_GATE_SET);

**Example Files:**
None

**Also See:**
setup_clcx(), clcx_setup_input()

---

### clear_interrupt()

**Syntax:**
clear_interrupt(level)

**Parameters:**
- **level** - a constant defined in the devices.h file

**Returns:**
undefined

**Function:**
Clears the interrupt flag for the given level. This function is designed
for use with a specific interrupt, thus eliminating the GLOBAL level as a possible parameter. Some chips that have interrupt on change for individual pins allow the pin to be specified like INT_RA1.

### Availability:
All devices

### Requires:
Nothing

### Examples:
clear_interrupt(int_timer1);

### Example Files:
None

### Also See:
enable_interrupts(), #INT, Interrupts Overview
disable_interrupts(), interrupt_active()

clear_pwm1_interrupt()
clear_pwm2_interrupt()
clear_pwm3_interrupt()
clear_pwm4_interrupt()
clear_pwm5_interrupt()
clear_pwm6_interrupt()

### Syntax:
clear_pwm1_interrupt (interrupt)
clear_pwm2_interrupt (interrupt)
clear_pwm3_interrupt (interrupt)
clear_pwm4_interrupt (interrupt)
clear_pwm5_interrupt (interrupt)
clear_pwm6_interrupt (interrupt)

### Parameters:
- **interrupt** - 8-bit constant or variable. Constants are defined in the device's header file as:
  - PWM_PERIOD_INTERRUPT
  - PWM_DUTY_INTERRUPT
  - PWM_PHASE_INTERRUPT
  - PWM_OFFSET_INTERRUPT

### Returns:
undefined.

### Function:
Clears one of the above PWM interrupts, multiple interrupts can be cleared by or'ing multiple options together.
Built-in Functions

Availability: Devices with a 16-bit PWM module.

Requires: Nothing

Examples:
clear_pwm1_interrupt(PWM_PERIOD_INTERRUPT);
clear_pwm1_interrupt(PWM_PERIOD_INTERRUPT | PWM_DUTY_INTERRUPT);

Example Files: setup_pwm(), set_pwm_duty(), set_pwm_phase(), set_pwm_period(),
set_pwm_offset(), enable_pwm_interrupt(), disable_pwm_interrupt(),
pwm_interrupt_active()

Also See:

\[ \text{cog\_status( )} \]

Syntax:
\[
\text{value = cog\_status();}
\]

Parameters: None

Returns: \text{value} - the status of the COG module

Function: To determine if a shutdown event occurred on the Complementary Output Generator (COG) module.

Availability: All devices with a COG module.

Examples:
\[
\text{if(cog\_status()==\text{COG\_AUTO\_SHUTDOWN})}
  \text{cog\_restart();}
\]

Example Files: None

Also See: setup_cog(), set_cog_dead_band(), set_cog_blanking(),
set_cog_phase(), cog\_restart()

\[ \text{cog\_restart( )} \]

Syntax: \text{cog\_restart();}

Parameters: None

Returns: Nothing

Function: To restart the Complementary Output Generator (COG) module after an auto-shutdown
event occurs, when not using auto-restart option of module.

**Availability:**
All devices with a COG module.

**Examples:**
```c
if (cog_status() == COG_AUTO_SHUTDOWN)
    cog_restart();
```

**Example Files:**
None

**Also See:**
setup_cog(), set_cog_dead_band(), set_cog_blanking(),
set_cog_phase(), cog_status()

crc_calc( )    crc_calc8( )    crc_calc16( )

**Syntax:**
```c
Result = crc_calc (data,[width]);
Result = crc_calc(ptr,len,[width]);
Result = crc_calc8(data,[width]);
Result = crc_calc8(ptr,len,[width]);
Result = crc_calc16(data,[width]); //same as crc_calc()
Result = crc_calc16(ptr,len,[width]); //same as crc_calc()
```

**Parameters:**
- **data** - This is one double word, word or byte that needs to be processed when using crc_calc16( ), or crc_calc8( )
- **ptr** - is a pointer to one or more double words, words or bytes of data
- **len** - number of double words, words or bytes to process for function calls crc_calc16( ), or crc_calc8( )
- **width** - optional parameter used to specify the input data bit width to use with the functions crc_calc16( ), and crc_calc8( )
  If not specified, it defaults to the width of the return value of the function, 8-bit for crc_calc8( ), 16-bit for crc_calc16( )
  For devices with a 16-bit for CRC the input data bit width is the same as the return bit width, crc_calc16( ) and 8-bit crc_calc8( ).

**Returns:**
Returns the result of the final CRC calculation.

**Function:**
This will process one data double word, word or byte or len double words, words or bytes of data using the CRC engine.

**Availability:**
Only the devices with built in CRC module.

**Requires:**
Nothing
### Built-in Functions

#### Examples:
```
int16 data[8];
Result = crc_calc(data,8);
```

#### Example Files:
None

#### Also See:
setup_crc(); crc_init()

---

### crc_init(mode)

<table>
<thead>
<tr>
<th>Syntax</th>
<th><code>crc_init(data);</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters</td>
<td><code>data</code> - This will setup the initial value used by write CRC shift register. Most commonly, this register is set to 0x0000 for start of a new CRC calculation.</td>

### cwg_status()

<table>
<thead>
<tr>
<th>Syntax</th>
<th><code>value = cwg_status();</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters</td>
<td>None</td>
</tr>
<tr>
<td>Returns</td>
<td>the status of the CWG module</td>
</tr>
<tr>
<td>Function</td>
<td>To determine if a shutdown event occurred causing the module to</td>
</tr>
</tbody>
</table>
**auto-shutdown**

**Availability:** On devices with a CWG module.

**Examples:**
```c
if(cwg_status() == CWG_AUTO_SHUTDOWN)
cwg_restart();
```

**Example Files:** None

**Also See:** `setup_cwg()`, `cwg_restart()`

---

**cwg_restart()**

**Syntax:**
```c
cwg_restart();
```

**Parameters:** None

**Returns:** Nothing

**Function:** To restart the CWG module after an auto-shutdown event occurs, when not using auto-raster option of module.

**Availability:** On devices with a CWG module.

**Examples:**
```c
if(cwg_status() == CWG_AUTO_SHUTDOWN)
cwg_restart();
```

**Example Files:** None

**Also See:** `setup_cwg()`, `cwg_status()`

---

**dac_write()**

**Syntax:**
```c
dac_write (value)
```

**Parameters:**
- **Value:** 8-bit integer value to be written to the DAC module

**Returns:** undefined

**Function:** This function will write a 8-bit integer to the specified DAC channel.

**Availability:** Only available on devices with built in digital to analog converters.
**Built-in Functions**

<table>
<thead>
<tr>
<th>Requires:</th>
<th>Nothing</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| int i = 0;  
| setup_dac(DAC_VDD | DAC_OUTPUT);  
| while(1){

|    dac_write(i);  
| } |
| 
| Examples: | setup_dac(), DAC Overview, see header file for device selected |
| 
| Also See:  |

### delay_cycles( )

**Syntax:**

```
delay_cycles (count)
```

**Parameters:**

- `count` - a constant 1-255

**Returns:**

undefined

**Function:**

Creates code to perform a delay of the specified number of instruction clocks (1-255). An instruction clock is equal to four oscillator clocks.

The delay time may be longer than requested if an interrupt is serviced during the delay. The time spent in the ISR does not count toward the delay time.

**Availability:**

All devices

**Requires:**

Nothing

**Examples:**

```
delay_cycles( 1 ); // Same as a NOP  
delay_cycles(25); // At 20 mhz a 5us delay
```

**Example Files:**

- `ex_cust.c`

**Also See:**

- `delay_us()`, `delay_ms()`

### delay_ms( )

**Syntax:**

```
delay_ms (time)
```
### Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>a variable 0-65535(int16) or a constant 0-65535</td>
</tr>
</tbody>
</table>

Note: Previous compiler versions ignored the upper byte of an int16, now the upper byte affects the time.

### Returns:

undefined

### Function:

This function will create code to perform a delay of the specified length. Time is specified in milliseconds. This function works by executing a precise number of instructions to cause the requested delay. It does not use any timers. If interrupts are enabled the time spent in an interrupt routine is not counted toward the time.

The delay time may be longer than requested if an interrupt is serviced during the delay. The time spent in the ISR does not count toward the delay time.

### Availability:

All devices

### Requires:

`#USE DELAY`

```c
#define delay (clock=20000000)
delay_ms( 2 );
```

### Examples:

```c
void delay_seconds(int n) {
    for (;n!=0; n--)
        delay_ms( 1000 );
}
```

### Example Files:

`ex_sqw.c`

### Also See:

`delay_us()`, `delay_cycles()`, `#USE DELAY`

---

**delay_us( )**

### Syntax:

`delay_us(time)`

### Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>a variable 0-65535(int16) or a constant 0-65535</td>
</tr>
</tbody>
</table>

Note: Previous compiler versions ignored the upper byte of an int16, now the upper byte affects the time.
### Built-in Functions

**Returns:** undefined

**Function:** Creates code to perform a delay of the specified length. Time is specified in microseconds. Shorter delays will be INLINE code and longer delays and variable delays are calls to a function. This function works by executing a precise number of instructions to cause the requested delay. It does not use any timers. If interrupts are enabled the time spent in an interrupt routine is not counted toward the time.

The delay time may be longer than requested if an interrupt is serviced during the delay. The time spent in the ISR does not count toward the delay time.

**Availability:** All devices

**Requires:** #USE DELAY

```c
#use delay(clock=20000000)

do {
  output_high(PIN_B0);
  delay_us(duty);
  output_low(PIN_B0);
  delay_us(period-duty);
} while(TRUE);
```

**Examples:**

- **Example Files:** ex_sqw.c

**Also See:** delay_ms(), delay_cycles(), #USE DELAY

---

**disable_interruptions( )**

**Syntax:** disable_interruptions (level)

**Parameters:** level - a constant defined in the devices .h file

**Returns:** undefined

**Function:** Disables the interrupt at the given level. The GLOBAL level will not disable any of the specific interrupts but will prevent any of the specific interrupts, previously enabled to be active. Valid specific levels are the same as are used in #INT_xxx and are listed in the devices .h file. GLOBAL will also disable the peripheral interrupts on devices that have it. Note that it is not necessary to disable interrupts inside an interrupt service routine since interrupts are automatically disabled. Some chips that have interrupt on change for individual
pins allow the pin to be specified like INT_RA1.

**Availability:** Device with interrupts (PCM and PCH)

**Requires:** Should have a #INT_xxxx, constants are defined in the devices .h file.

```c
disable_interrupts(GLOBAL);  // all interrupts OFF
disable_interrupts(INT_RDA);  // RS232 OFF

enable_interrupts(ADC_DONE);
enable_interrupts(RB_CHANGE);
// these enable the interrupts
// but since the GLOBAL is disabled they
// are not activated until the following
// statement:
enable_interrupts(GLOBAL);
```

**Example Files:**  
[ex_sisr.c, ex_stwt.c]

**Also See:**  
enable_interrupts(), clear_interrupt(), #INT_xxxx, Interrupts Overview, interrupt_active()

---

```
disable_pwm1_interrupt( )
disable_pwm2_interrupt( )
disable_pwm3_interrupt( )
disable_pwm4_interrupt( )
disable_pwm5_interrupt( )
disable_pwm6_interrupt( )
```

**Syntax:**  
```
disable_pwm1_interrupt (interrupt)
disable_pwm2_interrupt (interrupt)
disable_pwm3_interrupt (interrupt)
disable_pwm4_interrupt (interrupt)
disable_pwm5_interrupt (interrupt)
disable_pwm6_interrupt (interrupt)
```

**Parameters:**  
**interrupt** - 8-bit constant or variable. Constants are defined in the device’s header file as:
- PWM_PERIOD_INTERRUPT
- PWM_DUTY_INTERRUPT
Built-in Functions

- PWM_PHASE_INTERRUPT
- PWM_OFFSET_INTERRUPT

Returns: undefined.

Function: Disables one of the above PWM interrupts, multiple interrupts can be disabled by or'ing multiple options together.

Availability: Devices with a 16-bit PWM module.

Requires: Nothing

Examples:

```c
disable_pwm1_interrupt(PWM_PERIOD_INTERRUPT);
disable_pwm1_interrupt(PWM_PERIOD_INTERRUPT | PWM_DUTY_INTERRUPT);
```

Example Files: setup_pwm(), set_pwm_duty(), set_pwm_phase(), set_pwm_period(), set_pwm_offset(), enable_pwm_interrupt(), clear_pwm_interrupt(), pwm_interrupt_active()

Also See: div(), ldiv()

### div() ldiv()

**Syntax:**

```c
idiv=div(num, denom)
ldiv =ldiv(Inum, Idenom)
```

**Parameters:**

- `num` and `denom` are signed integers.
- `num` is the numerator and `denom` is the denominator.
- `Inum` and `ldenom` are signed longs.
- `Inum` is the numerator and `ldenom` is the denominator.

**Returns:**

- `idiv` is a structure of type `div_t` and `ldiv` is a structure of type `ldiv_t`. The div function returns a structure of type `div_t`, comprising of both the quotient and the remainder. The ldiv function returns a structure of type `ldiv_t`, comprising of both the quotient and the remainder.

**Function:**

The div and ldiv function computes the quotient and remainder of the division of the numerator by the denominator. If the division is inexact, the resulting quotient is the integer or long of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise `quot*denom(ldenom)+rem shall equal num(Inum)`. 

---

191
enable_interrupts( )

Syntax:      enable_interrupts (level)

Parameters: level is a constant defined in the devices *.h file.

Returns:    undefined.

Function: This function enables the interrupt at the given level. An interrupt procedure should have been defined for the indicated interrupt.

The GLOBAL level will not enable any of the specific interrupts, but will allow any of the specified interrupts previously enabled to become active. Some chips that have an interrupt on change for individual pins all the pin to be specified, such as INT_RA1. For interrupts that use edge detection to trigger, it can be setup in the enable_interrupts( ) function without making a separate call to the set_int_edge( ) function.

Enabling interrupts does not clear the interrupt flag if there was a pending interrupt prior to the call. Use the clear_interrupt( ) function to clear pending interrupts before the call to enable_interrupts( ) to discard the prior interrupts.

Availability: Devices with interrupts.

Requires: Should have a #INT_XXXX to define the ISR, and constants are defined in the devices *.h file.
### enable_pwm1_interrupt()
### enable_pwm2_interrupt()
### enable_pwm3_interrupt()
### enable_pwm4_interrupt()
### enable_pwm5_interrupt()
### enable_pwm6_interrupt()

**Syntax:**
```
enable_pwm1_interrupt (interrupt)
enable_pwm2_interrupt (interrupt)
enable_pwm3_interrupt (interrupt)
enable_pwm4_interrupt (interrupt)
enable_pwm5_interrupt (interrupt)
enable_pwm6_interrupt (interrupt)
```

**Parameters:**
- `interrupt` - 8-bit constant or variable. Constants are defined in the device’s header file as:
  - PWM_PERIOD_INTERRUPT
  - PWM_DUTY_INTERRUPT
  - PWM_PHASE_INTERRUPT
  - PWM_OFFSET_INTERRUPT

**Returns:**
undefined.

**Function:**
Enables one of the above PWM interrupts, multiple interrupts can be enabled by or’ing multiple options together. For the interrupt to occur, the overall PWMx interrupt still needs to be enabled and an interrupt service routine still needs to be created.

**Availability:**
Devices with a 16-bit PWM module.

**Requires:**
Nothing

**Examples:**
```
enable_pwm1_interrupt(PWM_PERIOD_INTERRUPT);
```
enable_pwm1_interrupt(PWM_PERIOD_INTERRUPT | PWM_DUTY_INTERRUPT);

Example Files: setup_pwm(), set_pwm_duty(), set_pwm_phase(), set_pwm_period(), set_pwm_offset(), disable_pwm_interrupt(), clear_pwm_interrupt(), pwm_interrupt_active()

Also See: setup_pwm(), set_pwm_duty(), set_pwm_phase(), set_pwm_period(), set_pwm_offset(), disable_pwm_interrupt(), clear_pwm_interrupt(), pwm_interrupt_active()

**erase_eeprom( )**

**Syntax:**
```
erase_eeprom (address);
```

**Parameters:**
address is 8 bits on PCB parts.

**Returns:**
undefined

**Function:**
This will erase a row of the EEPROM or Flash Data Memory.

**Availability:**
PCB devices with EEPROM like the 12F519

**Requires:**
Nothing

**Examples:**
```
erase_eeprom(0); // erase the first row of the EEPROM (8 bytes)
```

**Example Files:**
None

**Also See:** write program eeprom(), write program memory(), Program Eeprom Overview

**erase_program_eeprom( )**

**Syntax:**
```
erase_program_eeprom (address);
```

**Parameters:**
address is 16 bits on PCM parts and 32 bits on PCH parts. The least significant bits may be ignored.

**Returns:**
undefined

**Function:**
Erases FLASH_ERASE_SIZE bytes to 0xFFFF in program memory.
FLASH_ERASE_SIZE varies depending on the part. For example, if it is 64 bytes then the least significant 6 bits of address is ignored.

See write_program_memory() for more information on program memory access.

**Availability:** Only devices that allow writes to program memory.

**Requires:** Nothing

**Examples:**
```
for(i=0x1000;i<=0x1fff;i+=getenv("FLASH_ERASE_SIZE"))
   erase_program_memory(i);
```

**Example Files:** None

**Also See:**
write program eeprom(), write program memory(), Program Eeprom Overview

---

### exp( )

**Syntax:**
```
result = exp (value)
```

**Parameters:**
- `value` is a float

**Returns:**
A float

**Function:** Computes the exponential function of the argument. This is e to the power of value where e is the base of natural logarithms. exp(1) is 2.7182818.

Note on error handling:
If "errno.h" is included then the domain and range errors are stored in the errno variable. The user can check the errno to see if an error has occurred and print the error using the perror function.

Range error occur in the following case:
- `exp`: when the argument is too large

**Availability:** All devices

**Requires:** #INCLUDE <math.h>

```
// Calculate x to the power of y
x_power_y = exp( y * log(x) );
```
### ext_int_edge()

**Syntax:**
```
ext_int_edge (source, edge)
```

**Parameters:**
- `source` is a constant 0,1 or 2 for the PIC18XXX and 0 otherwise. Source is optional and defaults to 0.
- `edge` is a constant H_TO_L or L_TO_H representing "high to low" and "low to high"

**Returns:**
undefined

**Function:** Determines when the external interrupt is acted upon. The edge may be L_TO_H or H_TO_L to specify the rising or falling edge.

**Availability:** Only devices with interrupts (PCM and PCH)

**Requires:** Constants are in the devices .h file

**Examples:**
```
ext_int_edge( 2, L_TO_H); // Set up PIC18 EXT2
ext_int_edge( H_TO_L ); // Sets up EXT
```

**Example Files:** `ex_wakup.c`

**Also See:** #INT_EXT, enable_interrupts(), disable_interrupts(), Interrupts Overview

### fabs()

**Syntax:**
```
result=fabs (value)
```

**Parameters:**
- `value` is a float

**Returns:**
result is a float

**Function:** The fabs function computes the absolute value of a float

**Availability:** All devices.

**Requires:** #INCLUDE <math.h>

result has the same sign as val1 and magnitude less than the magnitude of val2.

### Availability:
All devices.

### Requires:
`#INCLUDE <math.h>`

### Examples:
```c
float result;
result=fmod(3,2);
// result is 1
```

### Example Files:
None

### Also See:
None

---

### free( )

#### Syntax:
`free(ptr)`

#### Parameters:
`ptr` is a pointer earlier returned by the `calloc`, `malloc` or `realloc`.

#### Returns:
No value

#### Function:
The `free` function causes the space pointed to by the `ptr` to be deallocated, that is made available for further allocation. If `ptr` is a null pointer, no action occurs. If the `ptr` does not match a pointer earlier returned by the `calloc`, `malloc` or `realloc`, or if the space has been deallocated by a call to `free` or `realloc` function, the behavior is undefined.

### Availability:
All devices.

### Requires:
`#INCLUDE <stdlibm.h>`

```c
int * iptr;
iptr=malloc(10);
free(iptr)
// iptr will be deallocated
```

### Example Files:
None

### Also See:
`realloc()`, `malloc()`, `calloc()`
### frexp( )

**Syntax:**

```
result=frexp (value, &exp);
```

**Parameters:**

- **value** is a float
- **exp** is a signed int.

**Returns:**

result is a float

**Function:**

The frexp function breaks a floating point number into a normalized fraction and an integral power of 2. It stores the integer in the signed int object exp. The result is in the interval [1/2 to 1) or zero, such that value is result times 2 raised to power exp. If value is zero then both parts are zero.

**Availability:**

All devices.

**Requires:**

```
#include <math.h>
```

**Examples:**

```c
float result;
signed int exp;
result=frexp(.5,&exp);
// result is .5 and exp is 0
```

**Example Files:**

None

**Also See:**

ldexp(), exp(), log(), log10(), modf()

### scanf( )

**Syntax:**

```
scanf(cstring);
scanf(cstring, values...)
fscanf(stream, cstring, values...)
```

**Parameters:**

- **cstring** is a constant string.
- **values** is a list of variables separated by commas.
- **stream** is a stream identifier.

**Returns:**

0 if a failure occurred, otherwise it returns the number of conversion specifiers that were read in, plus the number of constant strings read in.

**Function:**

Reads in a string of characters from the standard RS-232 pins and
formats the string according to the format specifiers. The format specifier character (%) used within the string indicates that a conversion specification is to be done and the value is to be saved into the corresponding argument variable. A %% will input a single %.

Formatting rules for the format specifier as follows:

If fscanf() is used, then the specified stream is used, where scanf() defaults to STDIN (the last USE RS232).

**Format:**
The format takes the generic form %nt. n is an option and may be 1-99 specifying the field width, the number of characters to be inputted. t is the type and maybe one of the following:

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Matches a sequence of characters of the number specified by the field width (1 if no field width is specified). The corresponding argument shall be a pointer to the initial character of an array long enough to accept the sequence.</td>
</tr>
<tr>
<td>s</td>
<td>Matches a sequence of non-white space characters. The corresponding argument shall be a pointer to the initial character of an array long enough to accept the sequence and a terminating null character, which will be added automatically.</td>
</tr>
<tr>
<td>u</td>
<td>Matches an unsigned decimal integer. The corresponding argument shall be a pointer to an unsigned integer.</td>
</tr>
<tr>
<td>Lu</td>
<td>Matches a long unsigned decimal integer. The corresponding argument shall be a pointer to a long unsigned integer.</td>
</tr>
<tr>
<td>d</td>
<td>Matches a signed decimal integer. The corresponding argument shall be a pointer to a signed integer.</td>
</tr>
<tr>
<td>Ld</td>
<td>Matches a long signed decimal integer. The corresponding argument shall be a pointer to a long signed integer.</td>
</tr>
<tr>
<td>o</td>
<td>Matches a signed or unsigned octal integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Lo</td>
<td>Matches a long signed or unsigned octal integer. The corresponding argument shall be a pointer to a</td>
</tr>
<tr>
<td>Format</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>x or X</td>
<td>Matches a hexadecimal integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Lx or LX</td>
<td>Matches a long hexadecimal integer. The corresponding argument shall be a pointer to a long signed or unsigned integer.</td>
</tr>
<tr>
<td>i</td>
<td>Matches a signed or unsigned integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Li</td>
<td>Matches a long signed or unsigned integer. The corresponding argument shall be a pointer to a long signed or unsigned integer.</td>
</tr>
<tr>
<td>f, g or e</td>
<td>Matches a floating point number in decimal or exponential format. The corresponding argument shall be a pointer to a float.</td>
</tr>
<tr>
<td>[</td>
<td>Matches a non-empty sequence of characters from a set of expected characters. The sequence of characters included in the set are made up of all character following the left bracket ([]) up to the matching right bracket (]). Unless the first character after the left bracket is a ^, in which case the set of characters contain all characters that do not appear between the brackets. If a - character is in the set and is not the first or second, where the first is a ^, nor the last character, then the set includes all characters from the character before the - to the character after the -. For example, %[a-z] would include all characters from a to z in the set and %[^a-z] would exclude all characters from a to z from the set. The corresponding argument shall be a pointer to the initial character of an array long enough to accept the sequence and a terminating null character, which will be added automatically.</td>
</tr>
<tr>
<td>n</td>
<td>Assigns the number of characters read thus far by the call to scanf() to the corresponding argument. The corresponding argument shall be a pointer to an unsigned integer.</td>
</tr>
</tbody>
</table>

An optional assignment-suppressing character (*) can
be used after the format specifier to indicate that the conversion specification is to be done, but not saved into a corresponding variable. In this case, no corresponding argument variable should be passed to the scanf() function.

A string composed of ordinary non-white space characters is executed by reading the next character of the string. If one of the inputted characters differs from the string, the function fails and exits. If a white-space character precedes the ordinary non-white space characters, then white-space characters are first read in until a non-white space character is read.

White-space characters are skipped, except for the conversion specifiers [c or n], unless a white-space character precedes the [c or n] specifiers.

### Availability:
All Devices

### Requires:
#USE RS232

```c
char name[2-];
unsigned int8 number;
signed int32 time;
```

### Examples:
```c
if(scanf("%u%s%ld",&number,name,&time))
    printf("\nName: %s, Number: %u, Time: %ld",name,number,time);
```

</tbody>
</table>

#### get_capture_event()

**Syntax:**

```
result = get_capture_event([stream]);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in `#USE CAPTURE`.

**Returns:**

- TRUE if a capture event occurred, FALSE otherwise.

**Function:**

To determine if a capture event occurred.

**Availability:**

All devices.

**Requires:**

- `#USE CAPTURE`

**Examples:**

```c
#USE CAPTURE(INPUT=PIN_C2,CAPTURE_RISING,TIMER=1,FASTEST)
if(get_capture_event())
    result = get_capture_time();
```

**Example Files:**

None

**Also See:**

- `#use_capture`, `get_capture_time()`

#### get_capture_time()

**Syntax:**

```
result = get_capture_time([stream]);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in `#USE CAPTURE`.

**Returns:**

- An int16 value representing the last capture time.

**Function:**

To get the last capture time.
## get_capture32()

### Syntax:

\[
\text{result} = \text{get_capture32}(x, [\text{wait}]);
\]

### Parameters:
- \( x \) is 1-16 and defines which input capture result buffer modules to read from.
- \( \text{wait} \) is an optional parameter specifying if the compiler should read the oldest result in the buffer or the next result to enter the buffer.

### Returns:
A 32-bit timer value

### Function:
If \( \text{wait} \) is true, the current capture values in the result buffer are cleared, and the next result to be sent to the buffer is returned. If \( \text{wait} \) is false, the default setting, the first value currently in the buffer is returned. However, the buffer will only hold four results while waiting for them to be read, so if get_capture32 is not being called for every capture event. When \( \text{wait} \) is false, the buffer will fill with old capture values and any new results will be lost.

### Availability:
Only devices with a 32-bit Input Capture module

### Requires:
Nothing

```c
setup_timer2(TMR_INTERNAL | TMR_DIV_BY_1 | TMR_32_BIT);
setup_capture(1, CAPTURE_FE | CAPTURE_TIMER2 | CAPTURE_32_BIT);
while(TRUE) {
    timerValue = get_capture32(1, TRUE);
    printf("Capture 1 occurred at: %LU", timerValue);
}
```

### Example Files:
None
get_hspwm_capture(
)

Syntax:  

\[
\text{result} = \text{get\_hspwm\_capture}(\text{unit});
\]

Parameters:

\text{unit} - The High Speed PWM unit to set.

Returns:

Unsigned in16 value representing the capture PWM time base value.

Function:

Gets the captured PWM time base value from the leading edge detection on the current-limit input.

Availability:

Only on devices with a built-in High Speed PWM module (dsPIC33FJxxGSxxx, dsPIC33EPxxxMUxxx, dsPIC33EPxxxMCxxx, and dsPIC33EVxxxGMxxx devices)

Requires:

None

Examples:

\[
\text{result} = \text{get\_hspwm\_capture}(1);
\]

Example Files:

None

Also See:

setup_hspwm_unit(), set_hspwm_phase(), set_hspwm_duty(), set_hspwm_event(), setup_hspwm_blanking(), setup_hspwm_trigger(), set_hspwm_override(), setup_hspwm_chop_clock(), setup_hspwm_unit_chop_clock(), setup_hspwm(), setup_hspwm_secondary()

get_nco_accumulator(
)

Syntax:  

\[
\text{value} = \text{get\_nco\_accumulator}();
\]

Parameters:

none

Returns:

current value of accumulator.

Availability:

On devices with a NCO module.
get_nco_inc_value()

**Syntax:**

```c
value = get_nco_inc_value();
```

**Parameters:**

None

**Returns:**

- current value set in increment registers.

**Availability:**

On devices with a NCO module.

**Examples:**

```c
value = get_nco_inc_value();
```

**Example Files:**

None

**Also See:**

setup_nco(), set_nco_inc_value(), get_nco_accumulator()

get_ticks()

**Syntax:**

```c
value = get_ticks([stream]);
```

**Parameters:**

`stream` – optional parameter specifying the stream defined in #USE TIMER.

**Returns:**

- a 8, 16 or 32 bit integer. (int8, int16 or int32)

**Function:**

Returns the current tick value of the tick timer. The size returned depends on the size of the tick timer.

**Availability:**

All devices.

**Requires:**

#USE TIMER(options)

```c
#USE TIMER(TIMER=1,TICK=1ms,BITS=16,NOISR)
```

**Examples:**

```c
void main(void) {
    unsigned int16 current_tick;
    current_tick = get_ticks();
}
```
### Built-in Functions

<table>
<thead>
<tr>
<th>Example Files:</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Also See:</td>
<td>#USE TIMER, set_ticks()</td>
</tr>
</tbody>
</table>

#### get_timerA()

**Syntax:**

```plaintext
def get_timerA():
```

**Parameters:**

None

**Returns:**

The current value of the timer as an int8

**Function:**

Returns the current value of the timer. All timers count up. When a timer reaches the maximum value it will flip over to 0 and continue counting (254, 255, 0, 1, 2, …).

**Availability:**

This function is only available on devices with Timer A hardware.

**Requires:**

Nothing

**Examples:**

```plaintext
set_timerA(0);
while(timerA < 200);
```

**Example Files:**

None

**Also See:**

set_timerA(), setup_timer_A(), TimerA Overview

---

#### get_timerB()

**Syntax:**

```plaintext
def get_timerB():
```

**Parameters:**

None

**Returns:**

The current value of the timer as an int8

**Function:**

Returns the current value of the timer. All timers count up. When a timer reaches the maximum value it will flip over to 0 and continue counting (254, 255, 0, 1, 2, …).

**Availability:**

This function is only available on devices with Timer B hardware.
get_timerx( )

Syntax:  
value=get_timer0()  
value=get_timer1()  
value=get_timer2()  
value=get_timer3()  
value=get_timer4()  
value=get_timer5()  
value=get_timer6()  
value=get_timer7()  
value=get_timer8()  
value=get_timer10()  
value=get_timer12()  

Parameters:  
None

Returns:  
Timers 1, 3, 5 and 7 return a 16 bit int.  
Timers 2, 4, 6, 8, 10 and 12 return an 8 bit int.  

Function:  
Returns the count value of a real time clock/counter. RTCC and Timer0 are the same. All timers count up. When a timer reaches the maximum value it will flip over to 0 and continue counting (254, 255, 0, 1, 2...).

Availability:  
Timer 0 - All devices  
Timers 1 & 2 - Most but not all PCM devices  
Timer 3, 5 and 7 - Some PIC18 and Enhanced PIC16 devices  
Timer 4, 6, 8, 10 and 12 - Some PIC18 and Enhanced PIC16 devices

Requires:  
Nothing

Examples:  
set_timer0(0);  
while ( get_timer0() < 200 );

Example Files:  
ex_stwt.c
get_tris_x( )

Syntax:

value = get_tris_A();
value = get_tris_B();
value = get_tris_C();
value = get_tris_D();
value = get_tris_E();
value = get_tris_F();
value = get_tris_G();
value = get_tris_H();
value = get_tris_J();
value = get_tris_K();

Parameters: None

Returns: int16, the value of TRIS register

Function: Returns the value of the TRIS register of port A, B, C, D, E, F, G, H, J, or K.

Availability: All devices.

Requires: Nothing

Examples:

tris_a = GET_TRIS_A();

Example Files: None

Also See: input(), output_low(), output_high()

getc( )  getch( )  getchar( )  fgetc( )

Syntax:

value = getc()
value = fgetc(stream)
value = getch()
value = getchar()

Parameters: stream is a stream identifier (a constant byte)
Returns: An 8 bit character

Function: This function waits for a character to come in over the RS232 RCV pin and returns the character. If you do not want to hang forever waiting for an incoming character use kbhit() to test for a character available. If a built-in USART is used the hardware can buffer 3 characters otherwise GETC must be active while the character is being received by the PIC®.

If fgetc() is used then the specified stream is used where getc() defaults to STDIN (the last USE RS232).

Availability: All devices

Requires: #USE RS232

Examples:

```c
printf("Continue (Y,N)?");
do {
    answer=getch();
} while(answer!='Y' && answer!='N');
```

```c
#use rs232(baud=9600,xmit=pin_c6, rcv=pin_c7,stream=HOSTPC)
#use rs232(baud=1200,xmit=pin_b1, rcv=pin_b0,stream=GPS)
#use rs232(baud=9600,xmit=pin_b3, stream=DEBUG)
...
while(TRUE) {
    c=fgetc(GPS);
    fputc(c,HOSTPC);
    if(c==13)
        fprintf(DEBUG,"Got a CR\r\n");
}
```

Example Files: ex_stwt.c

Also See: putc(), kbhit(), printf(), #USE RS232, input.c, RS232 I/O Overview

**getenv( )**

Syntax: `value = getenv (cstring);`

Parameters: cstring is a constant string with a recognized keyword

Returns: A constant number, a constant string or 0
### Built-in Functions

**Function:**

This function obtains information about the execution environment. The following are recognized keywords. This function returns a constant 0 if the keyword is not understood.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

---

**gets( )**  **fgets( )**

**Syntax:**

```
gets (string)

value = fgets (string, stream)
```

**Parameters:**

- **string** is a pointer to an array of characters.
- **Stream** is a stream identifier (a constant byte)

**Returns:** undefined

**Function:** Reads characters (using getc()) into the string until a RETURN (value 13) is encountered. The string is terminated with a 0. Note that INPUT.C has a more versatile get_string function.

If fgets() is used then the specified stream is used where gets() defaults to STDIN (the last USE RS232).

**Availability:** All devices

**Requires:** #USE RS232

```
char string[30];

printf("Password: ");
gets(string);
if(strcmp(string, password))
    printf("OK");
```

**Example Files:** None
goto_address()

Syntax: \hspace{1cm} \texttt{goto}\_\texttt{address(location);} \\

Parameters: \hspace{1cm} location is a ROM address, 16 or 32 bit int. \\

Returns: \hspace{1cm} Nothing \\

Function: \hspace{1cm} This function jumps to the address specified by location. Jumps outside of the current function should be done only with great caution. This is not a normally used function except in very special situations. \\

Availability: \hspace{1cm} All devices \\

Requires: \hspace{1cm} Nothing \\

Examples: \hspace{1cm} \\
\begin{verbatim}
if(input(LOAD_REQUEST))
    goto_address(LOADER);
\end{verbatim} \\

Example Files: \hspace{1cm} setjmp.h \\

Also See: \hspace{1cm} label_address() \\

\addvspace{1cm}

high_speed_adc_done()

Syntax: \hspace{1cm} value = high_speed\_adc\_done([\texttt{pair}]); \\

Parameters: \hspace{1cm} \texttt{pair} – Optional parameter that determines which ADC pair’s ready flag to check. If not used all ready flags are checked. \\

Returns: \hspace{1cm} An int16. If pair is used 1 will be return if ADC is done with conversion, 0 will be return if still busy. If pair isn’t use it will return a bit map of which conversion are ready to be read. For example a return value of 0x0041 means that ADC pair 6, AN12 and AN13, and ADC pair 0, AN0 and AN1, are ready to be read.
### Built-in Functions

<table>
<thead>
<tr>
<th>Function:</th>
<th>Can be polled to determine if the ADC has valid data to be read.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability:</td>
<td>Only on dsPIC33FJxxGSxxx devices.</td>
</tr>
<tr>
<td>Requires:</td>
<td>None</td>

- `setup_high_speed_adc_pair()`
- `read_high_speed_adc()`

---

### `i2c_init()`

**Syntax:**

```c
i2c_init([stream],baud);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in `#USE I2C`.

- `baud` – if baud is 0, I2C peripheral will be disable. If baud is 1, I2C peripheral is initialized and enabled with baud rate specified in `#USE I2C` directive. If baud is > 1 then I2C peripheral is initialized and enabled to specified baud rate.

**Returns:**

Nothing

**Function:**

To initialize I2C peripheral at run time to specified baud rate.

**Availability:**

All devices.

**Requires:**

`#USE I2C`

**Examples:**

```c
#USE I2C(MASTER,I2C1, FAST,NOINIT)
i2c_init(TRUE); //initialize and enable I2C peripheral
to baud rate specified in //#USE I2C
i2c_init(500000); //initialize and enable I2C peripheral
```
to a baud rate of 500 KBPS

Example Files: None

Also See: I2C_POLL(), i2c_speed(), I2C_SlaveAddr(), I2C_ISR_STATE(), I2C_WRITE(), I2C_READ(), _USE_I2C(), I2C()

i2c_isr_state()

Syntax: state = i2c_isr_state();
        state = i2c_isr_state(stream);

Parameters: None

Returns: state is an 8 bit int
 0 - Address match received with R/W bit clear, perform i2c_read( ) to read the I2C address.
1-0x7F - Master has written data; i2c_read() will immediately return the data
0x80 - Address match received with R/W bit set; perform i2c_read( ) to read the I2C address, and use i2c_write( ) to pre-load the transmit buffer for the next transaction (next I2C read performed by master will read this byte).
0x81-0xFF - Transmission completed and acknowledged; respond with i2c_write() to pre-load the transmit buffer for the next transaction (the next I2C read performed by master will read this byte).

Function: Returns the state of I2C communications in I2C slave mode after an SSP interrupt. The return value increments with each byte received or sent.

If 0x00 or 0x80 is returned, an i2C_read( ) needs to be performed to read the I2C address that was sent (it will match the address configured by #USE I2C so this value can be ignored)

Availability: Devices with i2c hardware

Requires: #USE I2C

```c
#INT_SSP
void i2c_isr() {
    state = i2c_isr_state();
    if(state== 0 ) i2c_read();
    i2c_read();
    if(state == 0x80)
        i2c_read(2);
    if(state >= 0x80)
        i2c_write(send_buffer[state - 0x80]);
}```
Example Files: | ex_slave.c

Also See: | i2c_poll, i2c_speed, i2c_start, i2c_stop, i2c_slaveaddr, i2c_write, i2c_read, #USE I2C, I2C Overview

---

### i2c_poll()

**Syntax:**

```c
data = i2c_poll();
data = i2c_poll(stream);
```

**Parameters:**

- `stream` (optional) - specify the stream defined in #USE I2C

**Returns:**

- 1 (TRUE) or 0 (FALSE)

**Function:**

The `I2C_POLL()` function should only be used when the built-in SSP is used. This function returns TRUE if the hardware has a received byte in the buffer. When a TRUE is returned, a call to `I2C_READ()` will immediately return the byte that was received.

**Availability:**

Devices with built in I2C

**Requires:**

#USE I2C

**Examples:**

```c
if(i2c-poll())
    buffer [index]=i2c-read(); //read data
```

**Example Files:**

None

**Also See:**

i2c_speed, i2c_start, i2c_stop, i2c_slaveaddr, i2c_isr_state, i2c_write, i2c_read, #USE I2C, I2C Overview

---

### i2c_read()

**Syntax:**

```c
data = i2c_read();
data = i2c_read(ack);
data = i2c_read(stream, ack);
```

**Parameters:**

- `ack` - Optional, defaults to 1.

0 indicates do not ack.
1 indicates to ack.
2 slave only, indicates to not release clock at end of read. Use
when i2c_isr_state ()
returns 0x80.

**stream** - specify the stream defined in #USE I2C

**Returns:**
data - 8 bit int

**Function:** Reads a byte over the I2C interface. In master mode this function
will generate the clock and in slave mode it will wait for the
clock. There is no timeout for the slave, use i2c_poll() to prevent a
lockup. Use restart_wdt() in the #USE I2C to strobe the watch-dog
timer in the slave mode while waiting.

**Availability:** All devices.

**Requires:** #USE I2C

```c
i2c_start();
i2c_write(0x1a);
data1 = i2c_read(TRUE);
data2 = i2c_read(FALSE);
i2c_stop();
```

**Example Files:** ex_extee.c with 2416.c

**Also See:** i2c_poll, i2c_speed, i2c_start, i2c_stop, i2c_slaveaddr,
i2c_isr_state, i2c_write, #USE I2C, I2C Overview

---

### i2c_slaveaddr( )

**Syntax:**

```
I2C_SlaveAddr(addr);
I2C_SlaveAddr(stream, addr);
```

**Parameters:**

- `addr` = 8 bit device address
- `stream` (optional) - specifies the stream used in #USE I2C

**Returns:** Nothing

**Function:** This functions sets the address for the I2C interface in slave mode.

**Availability:** Devices with built in I2C

**Requires:** #USE I2C
# Built-in Functions

## i2c_SlaveAddr( )

### Examples:

```c
i2c_SlaveAddr(0x08);
i2c_SlaveAddr(i2cStream1, 0x08);
```

### Example Files:

```c
example_slave.c
```

### Also See:

`i2c_poll`, `i2c_speed`, `i2c_start`, `i2c_stop`, `i2c_isr_state`, `i2c_write`, `i2c_read`, `#USE I2C`, `I2C Overview`

## i2c_speed( )

### Syntax:

```c
i2c_speed( baud )
i2c_speed( stream, baud )
```

### Parameters:

- `baud`: the number of bits per second.
- `stream`: specify the stream defined in `#USE I2C`

### Returns:

Nothing.

### Function:

This function changes the I2C bit rate at run time. This only works if the hardware I2C module is being used.

### Availability:

All devices.

### Requires:

`#USE I2C`

### Examples:

```c
I2C_Speed (400000);
```

### Example Files:

none

### Also See:

`i2c_poll`, `i2c_start`, `i2c_stop`, `i2c_slaveaddr`, `i2c_isr_state`, `i2c_write`, `i2c_read`, `#USE I2C`, `I2C Overview`

## i2c_start( )

### Syntax:

```c
i2c_start()
i2c_start( stream )
i2c_start( stream, restart )
```

### Parameters:

- `stream`: specify the stream defined in `#USE I2C`
- `restart`: 2 – new restart is forced instead of start
1 – normal start is performed
0 (or not specified) – restart is done only if the compiler last
encountered a I2C_START and no I2C_STOP

Returns: undefined

Function: Issues a start condition when in the I2C master mode. After the
start condition the clock is held low until I2C_WRITE() is called. If
another I2C_start is called in the same function before an i2c_stop
is called, then a special restart condition is issued. Note that
specific I2C protocol depends on the slave device. The
I2C_START function will now accept an optional parameter. If 1 the
compiler assumes the bus is in the stopped state. If 2 the compiler
treats this I2C_START as a restart. If no parameter is passed a 2 is
used only if the compiler compiled a I2C_START last with no
I2C_STOP since.

Availability: All devices.

Requires: #USE I2C

Examples:
```c
i2c_start();
i2c_write(0xa0);     // Device address
i2c_write(address);  // Data to device
i2c_start();         // Restart
i2c_write(0xa1);     // to change data direction
data=i2c_read(0);     // Now read from slave
i2c_stop();
```

Example Files: ex_extee.c with 2416.c

Also See: i2c_poll, i2c_speed, i2c_stop, i2c_slaveaddr, i2c_isr_state,
i2c_write, i2c_read, #USE I2C, I2C Overview

---

### i2c_stop( )

**Syntax:**
```c
i2c_stop()
i2c_stop(stream)
```

**Parameters:**
stream: (optional) specify stream defined in #USE I2C

**Returns:** undefined

**Function:** Issues a stop condition when in the I2C master mode.
### Built-in Functions

**Availability:**
All devices.

**Requires:**
#USE I2C

**Examples:**
```
i2c_start();  // Start condition
i2c_write(0xa0); // Device address
i2c_write(5);  // Device command
i2c_write(12); // Device data
i2c_stop();   // Stop condition
```

**Example Files:**
ex_extee.c with 2416.c

**Also See:**
i2c_poll, i2c_speed, i2c_start, i2c_slaveaddr, i2c_isr_state, i2c_write, i2c_read, #USE I2C, I2C Overview

---

### i2c_write( )

**Syntax:**
```
i2c_write (data)
i2c_write (stream, data)
```

**Parameters:**
- `data` is an 8 bit int
- `stream` - specify the stream defined in #USE I2C

**Returns:**
This function returns the ACK Bit. 0 means ACK, 1 means NO ACK, 2 means there was a collision if in Multi_Master Mode. This does not return an ACK if using i2c in slave mode.

**Function:**
Sends a single byte over the I2C interface. In master mode this function will generate a clock with the data and in slave mode it will wait for the clock from the master. No automatic timeout is provided in this function. This function returns the ACK bit. The LSB of the first write after a start determines the direction of data transfer (0 is master to slave). Note that specific I2C protocol depends on the slave device.

**Availability:**
All devices.

**Requires:**
#USE I2C

**Examples:**
```
long cmd;
...
i2c_start();  // Start condition
i2c_write(0xa0); // Device address
```
### i2c_write(cmd); // Low byte of command
### i2c_write(cmd>>8); // High byte of command
### i2c_stop();    // Stop condition

**Example Files:**  ex_extee.c with 2416.c

**Also See:**  i2c_poll,  i2c_speed,  i2c_start,  i2c_stop,  i2c_slaveaddr,  
i2c_isr_state,  i2c_read,  #USE I2C,  I2C Overview

## input()

**Syntax:**

value = input (pin)

**Parameters:**

- **Pin** to read. Pins are defined in the devices .h file. The actual value is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows:  
  
  ```
  #define PIN_A3 43.
  ```

  The PIN could also be a variable. The variable must have a value equal to one of the constants (like PIN_A1) to work properly. The tristate register is updated unless the FAST_IO mode is set on port A. Note that doing I/O with a variable instead of a constant will take much longer time.

**Returns:**

- 0 (or FALSE) if the pin is low,
- 1 (or TRUE) if the pin is high

**Function:**

This function returns the state of the indicated pin. The method of I/O is dependent on the last USE _IO directive. By default with standard I/O before the input is done the data direction is set to input.

**Availability:**

All devices.

**Requires:**

Pin constants are defined in the devices .h file

```c
while ( !input(PIN_B1) );  
// waits for B1 to go high

if( input(PIN_A0) )
    printf("A0 is now high\r\n");

int16 i=PIN_B1;
while(!i);
//waits for B1 to go high
```

**Example Files:**  ex_pulse.c
### input_change_x( )

**Syntax:**

```c
value = input_change_a();
value = input_change_b();
value = input_change_c();
value = input_change_d();
value = input_change_e();
value = input_change_f();
value = input_change_g();
value = input_change_h();
value = input_change_i();
value = input_change_k();
```

**Parameters:** None

**Returns:** An 8-bit or 16-bit int representing the changes on the port.

**Function:** This function reads the level of the pins on the port and compares them to the results the last time the `input_change_x( )` function was called. A 1 is returned if the value has changed, 0 if the value is unchanged.

**Availability:** All devices.

**Requires:** None

**Examples:**

```c
pin_check = input_change_b();
```

**Example Files:** None

**Also See:** `input( ), output_low( ), output_high( ), #USE FIXED_IO, #USE FAST_IO, #USE STANDARD_IO, General Purpose I/O`

### input_state( )

**Syntax:**

```c
value = input_state(pin)
```

**Also See:** `input( ), output_x( ), output_y( ), #USE FIXED_IO, #USE FAST_IO, #USE STANDARD_IO, General Purpose I/O`
### Parameters:
*pin* to read. Pins are defined in the devices .h file. The actual value is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows: `#define PIN_A3 43`.

### Returns:
Bit specifying whether pin is high or low. A 1 indicates the pin is high and a 0 indicates it is low.

### Function:
This function reads the level of a pin without changing the direction of the pin as `INPUT()` does.

### Availability:
All devices.

### Requires:
Nothing

```c
level = input_state(pin_A3);
printf("level: %d",level);
```

### Example Files:
None

### Also See:
`input()`, `set_tris_x()`, `output_low()`, `output_high()`, General Purpose I/O

---

#### input_x()

### Syntax:

```
value = input_a()
value = input_b()
value = input_c()
value = input_d()
value = input_e()
value = input_f()
value = input_g()
value = input_h()
value = input_i()
value = input_k()
```

### Parameters:
None

### Returns:
An 8 bit int representing the port input data.

### Function:
Inputs an entire byte from a port. The direction register is changed in accordance with the last specified `#USE *_IO` directive. By
**Built-in Functions**

</table>

**Availability:** All devices.

**Requires:** Nothing

**Examples:**
```
data = input_b();
```

**Example Files:** `ex_psp.c`

**Also See:** `input()`, `output_x()`, `#USE FIXED_IO`, `#USE FAST_IO`, `#USE STANDARD_IO`

---

**interrupt_active()**

**Syntax:** `interrupt_active(interrupt)`

**Parameters:** `Interrupt` – constant specifying the interrupt

**Returns:** Boolean value

**Function:** The function checks the interrupt flag of the specified interrupt and returns true in case the flag is set.

**Availability:** Device with interrupts

**Requires:** Should have a `#INT_xxxx`, Constants are defined in the devices .h file.

**Examples:**
```
interrupt_active(INT_TIMER0);
interrupt_active(INT_TIMER1);
```

**Example Files:** None

**Also See:** `disable_interrupts()`, `#INT`, `Interrupts Overview clear_interrupt`, `enable_interrupts()`

---

**isalnum(char)**

**isalpha(char)**

**iscntrl(x)**

**isdigit(char)**

**isgraph(x)**

**islower(char)**
### isspace(char)
isupper(char)
isxdigit(char)
isprint(x)
ispunct(x)

**Syntax:**

```c
value = isalnum(datac)
value = isalpha(datac)
value = isdigit(datac)
value = islower(datac)
value = isspace(datac)
value = isupper(datac)
value = isxdigit(datac)
value = iscntrl(datac)
value = isgraph(datac)
value = isprint(datac)
value = punct(datac)
```

**Parameters:**

`datac` is a 8 bit character

**Returns:**

0 (or FALSE) if `datac` dose not match the criteria, 1 (or TRUE) if `datac` does match the criteria.

**Function:**
Tests a character to see if it meets specific criteria as follows:

- `isalnum(x)` X is 0..9, 'A'..'Z', or 'a'..'z'
- `isalpha(x)` X is 'A'..'Z' or 'a'..'z'
- `isdigit(x)` X is '0'..'9'
- `islower(x)` X is 'a'..'z'
- `isupper(x)` X is 'A'..'Z'
- `isspace(x)` X is a space
- `isxdigit(x)` X is '0'..'9', 'A'..'F', or 'a'..'f'
- `iscntrl(x)` X is less than a space
- `isgraph(x)` X is greater than a space
- `isprint(x)` X is greater than or equal to a space
- `ispunct(x)` X is greater than a space and not a letter or number

**Availability:**
All devices.

**Requires:**

```
#include <ctype.h>
```

```c
char id[20];
...
if(isalpha(id[0])) {
    valid_id=TRUE;
    for(i=1;i<strlen(id);i++)
        valid_id=valid_id && isalnum(id[i]);
} else
```

**Examples:**
valid_id=FALSE;

Example Files: ex_str.c

Also See: isamong()

**ismamong( )**

Syntax: result = isamong (value, cstring)

Parameters: value is a character
cstring is a constant sting

Returns: 0 (or FALSE) if value is not in cstring
1 (or TRUE) if value is in cstring

Function: Returns TRUE if a character is one of the characters in a constant string.

Availability: All devices

Requires: Nothing

Example:
```
char x = 'x';
...
if ( isamong ( x, "0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ") )
    printf ("The character is valid");
```

Example Files: #INCLUDE <ctype.h>

Also See: isalnum(), isalpha(), isdigit(), isspace(), islower(), isupper(), isxdigit()

**itoa( )**

Syntax: string = itoa(i32value, i8base, string)

Parameters: i32value is a 32 bit int
i8base is a 8 bit int
string is a pointer to a null terminated string of characters
### string

**Returns:**
string is a pointer to a null terminated string of characters

**Function:**
Converts the signed int32 to a string according to the provided base and returns the converted value if any. If the result cannot be represented, the function will return 0.

**Availability:**
All devices

**Requires:**
#INCLUDE <stdlib.h>

```c
int32 x=1234;
char string[5];

itoa(x,10, string);
// string is now “1234”
```

**Examples:**
None

**Also See:**
None

---

### jump_to_isr( )

**Syntax:**
jump_to_isr (address)

**Parameters:**
address is a valid program memory address

**Returns:**
No value

**Function:**
The jump_to_isr function is used when the location of the interrupt service routines are not at the default location in program memory. When an interrupt occurs, program execution will jump to the default location and then jump to the specified address.

**Availability:**
All devices

**Requires:**
Nothing

```c
int_global
void global_isr(void) {
    jump_to_isr(isr_address);
}
```

**Examples:**
None

**Example Files:**
ex_bootloader.c

**Also See:**
#BUILD
**kbhit()**

**Syntax:**

```plaintext
value = kbhit()
value = kbhit(stream)
```

**Parameters:**

*stream* is the stream id assigned to an available RS232 port. If the stream parameter is not included, the function uses the primary stream used by getc().

**Returns:**

0 (or FALSE) if getc() will need to wait for a character to come in, 1 (or TRUE) if a character is ready for getc()

**Function:**

If the RS232 is under software control this function returns TRUE if the start bit of a character is being sent on the RS232 RCV pin. If the RS232 is hardware this function returns TRUE if a character has been received and is waiting in the hardware buffer for getc() to read. This function may be used to poll for data without stopping and waiting for the data to appear. Note that in the case of software RS232 this function should be called at least 10 times the bit rate to ensure incoming data is not lost.

**Availability:**

All devices.

**Requires:**

`#USE RS232`

```c
char timed_getc() {

    long timeout;

    timeout_error=FALSE;
    timeout=0;
    while(!kbhit()&&(++timeout<50000)) // 1/2 second
                                // second
        delay_us(10);
    if(kbhit()) {
        return(getc());
    } else {
        timeout_error=TRUE;
        return(0);
    }
}
```

**Examples:**

```c
Example Files: ex_tgetc.c
```

**Also See:**

getc(), `#USE RS232`, RS232 I/O Overview
### label_address( )

**Syntax:**

\[
\text{value} = \text{label_address}(\text{label});
\]

**Parameters:**

*label* is a C label anywhere in the function

**Returns:**

A 16 bit int in PCB,PCM and a 32 bit int for PCH, PCD

**Function:**

This function obtains the address in ROM of the next instruction after the label. This is not a normally used function except in very special situations.

**Availability:**

All devices.

**Requires:**

Nothing

**Examples:**

```c
start:
   a = (b+c)<<2;
end:

printf("It takes %lu ROM locations.\n", 
       label_address(end)-label_address(start));
```

**Example Files:**

`setjmp.h`

**Also See:**

`goto_address()`

### labs( )

**Syntax:**

\[
\text{result} = \text{labs}(\text{value})
\]

**Parameters:**

*value* is a 16 bit signed long int

**Returns:**

A 16 bit signed long int

**Function:**

Computes the absolute value of a long integer.

**Availability:**

All devices.

**Requires:**

`#INCLUDE <stdlib.h>`

**Examples:**

```c
if(labs( target_value - actual_value ) > 500)
   printf("Error is over 500 points\n");
```
### Built-in Functions

<table>
<thead>
<tr>
<th>Example Files:</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Also See:</td>
<td>abs()</td>
</tr>
</tbody>
</table>

### lcd_contrast( )

**Syntax:**

```plaintext
lcd_contrast( contrast )
```

**Parameters:**

- `contrast` is used to set the internal contrast control resistance ladder.

**Returns:**

undefined.

**Function:**

This function controls the contrast of the LCD segments with a value passed in between 0 and 7. A value of 0 will produce the minimum contrast, 7 will produce the maximum contrast.

**Availability:**

Only on select devices with built-in LCD Driver Module hardware.

**Requires:**

None.

**Examples:**

```plaintext
lcd_contrast( 0 );  // Minimum Contrast
lcd_contrast( 7 );  // Maximum Contrast
```

### lcd_load( )

**Syntax:**

```plaintext
lcd_load( buffer_pointer, offset, length);
```

**Parameters:**

- `buffer_pointer` points to the user data to send to the LCD,
- `offset` is the offset into the LCD segment memory to write the data,
- `length` is the number of bytes to transfer to the LCD segment memory.

**Returns:**

undefined.

**Function:**

This function will load `length` bytes from `buffer_pointer` into the LCD segment memory beginning at `offset`. The `lcd_symbol()` function provides as easier way to write data to the segment memory.

**Also See:**

`lcd_load()`, `lcd_symbol()`, `setup_lcd()`, `Internal LCD Overview`
**Availability:**
Only on devices with built-in LCD Driver Module hardware.

**Requires**
Constants are defined in the devices *.h file.

**Examples:**
lcd_load(buffer, 0, 16);

**Example Files:**
ex_92lcd.c

**Also See:**
lcd_symbol(), setup_lcd(), lcd_contrast(), Internal LCD Overview

---

## lcd_symbol()

**Syntax:**
lcd_symbol (symbol, bX_addr);

**Parameters:**
- `symbol` is a 8 bit or 16 bit constant.
- `bX_addr` is a bit address representing the segment location to be used for bit X of the specified symbol.

1-16 segments could be specified.

**Returns:**
undefined

**Function:**
This function loads the bits for the symbol into the segment data registers for the LCD with each bit address specified. If bit X in symbol is set, the segment at bX_addr is set, otherwise it is cleared. The bX_addr is a bit address into the LCD RAM.

**Availability:**
Only on devices with built-in LCD Driver Module hardware.

**Requires**
Constants are defined in the devices *.h file.

```c
byte CONST DIGIT_MAP[10] = {0xFC, 0x60, 0xDA, 0xF2, 0x66, 0xB6, 0xBE, 0xE0, 0xFE, 0xE6};

#define DIGIT1 COM1+20, COM1+18, COM2+18, COM3+20, COM2+28, COM1+28, COM2+20, COM3+18

for(i = 0; i <= 9; i++) {
    lcd_symbol( DIGIT_MAP[i], DIGIT1 );
    delay_ms( 1000 );
}
```

**Example Files:**
ex_92lcd.c

**Also See:**
setup_lcd(), lcd_load(), lcd_contrast(), Internal LCD Overview
### ldexp()

**Syntax:**

```c
result = ldexp (value, exp);
```

**Parameters:**

- `value` is float
- `exp` is a signed int.

**Returns:**

result is a float with value result times 2 raised to power exp.

**Function:**

The ldexp function multiplies a floating-point number by an integral power of 2.

**Availability:**

All devices.

**Requires:**

```c
#include <math.h>
```

**Examples:**

```c
float result;
result = ldexp(.5, 0);
// result is .5
```

**Example Files:**

None

**Also See:**

frexp(), exp(), log(), log10(), modf()

---

### log()

**Syntax:**

```c
result = log (value)
```

**Parameters:**

- `value` is a float

**Returns:**

A float

**Function:**

Computes the natural logarithm of the float x. If the argument is less than or equal to zero or too large, the behavior is undefined.

Note on error handling:

"errno.h" is included then the domain and range errors are stored in the errno variable. The user can check the errno to see if an error has occurred and print the error using the perror function.

Domain error occurs in the following cases:

- log: when the argument is negative
### log10( )

**Syntax:** \[ result = \log_{10}(value) \]

**Parameters:** 
- `value` is a float

**Returns:** A float

**Function:** Computes the base-ten logarithm of the float `x`. If the argument is less than or equal to zero or too large, the behavior is undefined.

Note on error handling: If "errno.h" is included then the domain and range errors are stored in the errno variable. The user can check the errno to see if an error has occurred and print the error using the perror function.

Domain error occurs in the following cases:
- `log10`: when the argument is negative

**Availability:** All devices

**Requires:** `#INCLUDE <math.h>`

**Examples:**

\[ \text{db} = \log_{10}( \text{read_adc()} \times (5.0/255) \times 10); \]

**Example Files:** None

**Also See:** `log()`, `exp()`, `pow()`
**longjmp( )**

**Syntax:**

`longjmp (env, val)`

**Parameters:**

`env`: The data object that will be restored by this function  
`val`: The value that the function setjmp will return. If `val` is 0 then the function setjmp will return 1 instead.

**Returns:**

After `longjmp` is completed, program execution continues as if the corresponding invocation of the `setjmp` function had just returned the value specified by `val`.

**Function:**

Performs the non-local transfer of control.

**Availability:**

All devices

**Requires:**

`#INCLUDE <setjmp.h>`

**Examples:**

`longjmp(jmpbuf, 1);`

**Example Files:**

None

**Also See:**

`setjmp()`

---

**make8( )**

**Syntax:**

`i8 = MAKE8(var, offset)`

**Parameters:**

`var` is a 16 or 32 bit integer.  
`offset` is a byte offset of 0, 1, 2 or 3.

**Returns:**

An 8 bit integer

**Function:**

Extracts the byte at offset from var. Same as:  
`i8 = (((var >> (offset*8)) & 0xff)`  
except it is done with a single byte move.

**Availability:**

All devices

**Requires:**

Nothing

**Examples:**

```c
int32 x;
int y;

y = make8(x, 3);  // Gets MSB of x
```
### make16( )

**Syntax:**

\[ i16 = \text{MAKE16}(\text{varhigh}, \text{varlow}) \]

**Parameters:**

*varhigh* and *varlow* are 8 bit integers.

**Returns:**

A 16 bit integer

**Function:**

Makes a 16 bit number out of two 8 bit numbers. If either parameter is 16 or 32 bits only the lsb is used. Same as: \( i16 = (\text{int16})(\text{varhigh}&0xff)*0x100+(\text{varlow}&0xff) \) except it is done with two byte moves.

**Availability:**

All devices

**Requires:**

Nothing

**Examples:**

```c
long x;
int hi,lo;

x = make16(hi,lo);
```

**Example Files:**

*ltc1298.c*

**Also See:**

*make8(), make32()*

### make32( )

**Syntax:**

\[ i32 = \text{MAKE32}(\text{var1}, \text{var2}, \text{var3}, \text{var4}) \]

**Parameters:**

*var1-4* are a 8 or 16 bit integers. *var2-4* are optional.

**Returns:**

A 32 bit integer

**Function:**

Makes a 32 bit number out of any combination of 8 and 16 bit
numbers. Note that the number of parameters may be 1 to 4. The msb is first. If the total bits provided is less than 32 then zeros are added at the msb.

**Availability:** All devices

**Requires:** Nothing

```
int32 x;
int y;
long z;

x = make32(1,2,3,4); // x is 0x01020304
```

**Examples:**

```
y=0x12;
z=0x4321;

x = make32(y,z); // x is 0x00124321
x = make32(y,y,z); // x is 0x12124321
```

**Example Files:** ex_freqc.c

**Also See:** make8(), make16()

---

### malloc()

**Syntax:**

```c
ptr=malloc(size)
```

**Parameters:**

- `size` is an integer representing the number of bytes to be allocated.

**Returns:**

A pointer to the allocated memory, if any. Returns null otherwise.

**Function:**

The malloc function allocates space for an object whose size is specified by `size` and whose value is indeterminate.

**Availability:** All devices

**Requires:**

```c
#include <stdlib.h>
```

**Examples:**

```c
int * iptr;
iptr=malloc(10);
// iptr will point to a block of memory of 10 bytes.
```

**Example Files:** None

**Also See:** realloc(), free(), calloc()
### memcpy()  memmove()

**Syntax:**
- `memcpy(destination, source, n)`
- `memmove(destination, source, n)`

**Parameters:**
- `destination` is a pointer to the destination memory.
- `source` is a pointer to the source memory.
- `n` is the number of bytes to transfer.

**Returns:** undefined

**Function:** Copies `n` bytes from `source` to `destination` in RAM. Be aware that array names are pointers where other variable names and structure names are not (and therefore need a `&` before them).

Memmove performs a safe copy (overlapping objects doesn't cause a problem). Copying takes place as if the `n` characters from the source are first copied into a temporary array of `n` characters that doesn't overlap the destination and source objects. Then the `n` characters from the temporary array are copied to destination.

**Availability:** All devices

**Requires:** Nothing

**Examples:**
- `memcpy(&structA, &structB, sizeof(structA));`
- `memcpy(arrayA, arrayB, sizeof(arrayA));`
- `memcpy(&structA, &databyte, 1);`
- `char a[20]="hello"; memmove(a,a+2,5);`  // a is now "llo"

**Example Files:** None

**Also See:** `strcpy()`, `memset()`

---

### memset()

**Syntax:**
- `memset(destination, value, n)`

**Parameters:**
- `destination` is a pointer to memory.

**Examples:**
- `memset(&structA, &structB, sizeof(structA));`
- `memset(arrayA, arrayB, sizeof(arrayA));`
- `memset(&structA, &databyte, 1);`
- `char a[20]="hello"; memmove(a,a+2,5);`  // a is now "llo"

**Example Files:** None

**Also See:** `strcpy()`, `memset()`
### Built-in Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Sets n number of bytes, starting at destination, to value. Be aware that array names are pointers where other variable names and structure names are not (and therefore need a &amp; before them).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires</td>
<td>Nothing</td>
</tr>
<tr>
<td>Examples</td>
<td></td>
</tr>
</tbody>
</table>

```c
memset(arrayA, 0, sizeof(arrayA));
memset(arrayB, '?', sizeof(arrayB));
memset(&structA, 0xFF, sizeof(structA));
```

| Also See | memset() |

---

### modf( )

<table>
<thead>
<tr>
<th>Syntax</th>
<th><code>result= modf (value, &amp; integral)</code></th>
</tr>
</thead>
</table>
| Parameters | `value` is a float  
`integral` is a float |
| Returns | result is a float |
| Function | The `modf` function breaks the argument value into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part as a float in the object `integral`. |
| Availability | All devices |
| Requires | `#INCLUDE <math.h>` |
| Examples | 

```c
float result, integral;
result=modf(123.987, &integral);
// result is .987 and integral is 123.0000
```

| Example Files | None |
_mul( )

Syntax: prod=_mul(val1, val2);

Parameters: val1 and val2 are both 8-bit or 16-bit integers

Returns: A 16-bit integer if both parameters are 8-bit integers, or a 32-bit integer if both parameters are 16-bit integers.

Function: Performs an optimized multiplication. By accepting a different type than it returns, this function avoids the overhead of converting the parameters to a larger type.

Availability: All devices

Requires: Nothing

Examples:

```c
int a=50, b=100;
long int c;
c = _mul(a, b);  //c holds 5000
```

Example Files: None

Also See: None

nargs( )

Syntax: void foo(char * str, int count, ...)

Parameters: The function can take variable parameters. The user can use stdarg library to create functions that take variable parameters.

Returns: Function dependent.

Function: The stdarg library allows the user to create functions that supports variable arguments. The function that will accept a variable number of arguments must have at least one actual, known parameters, and it may have more. The number of arguments is often passed to the function in one of
its actual parameters. If the variable-length argument list can involve more that one type, the type information is generally passed as well. Before processing can begin, the function creates a special argument pointer of type va_list.

### Availability:
All devices

### Requires:
`#INCLUDE <stdarg.h>`

```c
int foo(int num, ...)
{
    int sum = 0;
    int i;
    va_list argptr; // create special argument pointer
    va_start(argptr,num); // initialize argptr
    for(i=0; i<num; i++)
        sum = sum + va_arg(argptr, int);
    va_end(argptr); // end variable processing
    return sum;
}

void main()
{
    int total;
    total = foo(2,4,6,9,10,2);
}
```

### Example Files:
None

### Also See:
`va_start()`, `va_end()`, `va_arg()`

### offsetof( )  offsetofbit( )

### Syntax:
```
value = offsetof(stype, field);
value = offsetofbit(stype, field);
```

### Parameters:
- **stype** is a structure type name.
- **Field** is a field from the above structure

### Returns:
An 8 bit byte

### Function:
These functions return an offset into a structure for the indicated field. 
`offsetof` returns the offset in bytes and `offsetofbit` returns the offset in bits.

### Availability:
All devices
Requires:

```
#include <stddef.h>
```

```
struct time_structure {
    int hour, min, sec;
    int zone : 4;
    int daylight_savings;
}
```

```
x = offsetof(time_structure, sec);
    // x will be 2
x = offsetofbit(time_structure, sec);
    // x will be 16
x = offsetof (time_structure,
               daylight_savings);
    // x will be 3
x = offsetofbit(time_structure,
                daylight_savings);
    // x will be 28
```

Example Files:

None

Also See:

None

---

**output_x( )**

**Syntax:**

```
output_a (value)
output_b (value)
output_c (value)
output_d (value)
output_e (value)
output_f (value)
output_g (value)
output_h (value)
output_i (value)
output_k (value)
```

**Parameters:**

`value` is a 8 bit int

**Returns:**

undefined

**Function:**

Output an entire byte to a port. The direction register is changed in accordance with the last specified #USE _IO directive.

**Availability:**

All devices, however not all devices have all ports (A-E)
Built-in Functions

**Requires:** Nothing

**Examples:**

```
OUTPUT_B(0xf0);
```

**Example Files:**

`ex_patg.c`

**Also See:**

`input()`, `output_low()`, `output_high()`, `output_float()`, `output_bit()`,

`#USE FIXED_IO`, `#USE FAST_IO`, `#USE STANDARD_IO`, General Purpose I/O

---

**output_bit()**

**Syntax:**

```
output_bit (pin, value)
```

**Parameters:**

*Pins* are defined in the devices .h file. The actual number is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows: 

```c
#define PIN_A3 43
```

The PIN could also be a variable. The variable must have a value equal to one of the constants (like PIN_A1) to work properly. The tristate register is updated unless the FAST_IO mode is set on port A. Note that doing I/O with a variable instead of a constant will take much longer time.

*Value* is a 1 or a 0.

**Returns:** undefined

**Function:**

Outputs the specified value (0 or 1) to the specified I/O pin. The method of setting the direction register is determined by the last

```c
#USE *_IO
directive.
```

**Availability:** All devices.

**Requires:** Pin constants are defined in the devices .h file

```c
output_bit( PIN_B0, 0);
// Same as output_low(pin_B0);

output_bit( PIN_B0,input( PIN_B1 ) );
// Make pin B0 the same as B1
```

**Examples:**

```c
output_bit( PIN_B0,shift_left(&data,1,input(PIN_B1)));
// Output the MSB of data to
// B0 and at the same time
// shift B1 into the LSB of data

int16 i=PIN_B0;
```
output_bit(i,shift_left(&data,1,input(PIN_B1)));  
// same as above example, but  
// uses a variable instead of a constant

**Example Files:**  
ex_extee.c  
9356.c

**Also See:**  
input(), output_low(), output_high(), output_float(), output_x(),  
#USE FIXED_IO, #USE FAST_IO, #USE STANDARD_IO, General  
Purpose I/O

## output_drive( )

**Syntax:**  
output_drive(pin)

**Parameters:**  
Pins are defined in the devices .h file. The actual value is a bit  
address. For example, port a (byte 5) bit 3 would have a value of  
5*8+3 or 43. This is defined as follows: #DEFINE PIN_A3 43.

**Returns:**  
undefined

**Function:**  
Sets the specified pin to the output mode.

**Availability:**  
All devices.

**Requires:**  
Pin constants are defined in the devices.h file.

**Examples:**  
output_drive(pin_A0);  // sets pin_A0 to output its  
value  
output_bit(pin_B0, input(pin_A0))  // makes B0 the same  
as A0

**Example Files:**  
None

**Also See:**  
input(), output_low(), output_high(), output_bit(), output_x(),  
output_float()
5*8+3 or 43. This is defined as follows: #DEFINE PIN_A3 43. The PIN could also be a variable to identify the pin. The variable must have a value equal to one of the constants (like PIN_A1) to work properly. Note that doing I/O with a variable instead of a constant will take much longer time.

| Returns:     | undefined |
| Function:    | Sets the specified pin to the input mode. This will allow the pin to float high to represent a high on an open collector type of connection. |
| Availability:| All devices. |
| Requires:    | Pin constants are defined in the devices .h file |

```c
if( (data & 0x80)==0 )
    output_low(pin_A0);
else
    output_float(pin_A0);
```

| Example Files: | None |
| Also See:      | input(), output_low(), output_high(), output_bit(), output_x(), output_drive(), #USE FIXED_IO, #USE FAST_IO, #USE STANDARD_IO, General Purpose I/O |

## output_high( )

### Syntax:

```c
output_high (pin)
```

### Parameters:

*Pin* to write to. Pins are defined in the devices .h file. The actual value is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows: #DEFINE PIN_A3 43. The PIN could also be a variable. The variable must have a value equal to one of the constants (like PIN_A1) to work properly. The tristate register is updated unless the FAST_IO mode is set on port A. Note that doing I/O with a variable instead of a constant will take much longer time.

### Returns:

undefined

### Function:

Sets a given pin to the high state. The method of I/O used is dependent on the last USE *_IO directive.

### Availability:

All devices.
output_low( )

Syntax: output_low (pin)

Parameters: Pins are defined in the devices .h file. The actual value is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows: #DEFINE PIN_A3 43. The PIN could also be a variable. The variable must have a value equal to one of the constants (like PIN_A1) to work properly. The tristate register is updated unless the FAST_IO mode is set on port A. Note that doing I/O with a variable instead of a constant will take much longer time.

Returns: undefined

Function: Sets a given pin to the ground state. The method of I/O used is dependent on the last USE *_IO directive.

Availability: All devices.

Requires: Pin constants are defined in the devices .h file

Examples: output_low(PIN_A0);

Also See: input(), output_high(), output_float(), output_bit(), output_x(), #USE FIXED_IO, #USE FAST_IO, #USE STANDARD_IO, General Purpose I/O
## output_toggle( )

**Syntax:**

```c
output_toggle(pin)
```

**Parameters:**

- `Pins` are defined in the devices .h file. The actual value is a bit address. For example, port a (byte 5) bit 3 would have a value of 5*8+3 or 43. This is defined as follows: `#DEFINE PIN_A3 43`.

**Returns:**

Undefined

**Function:**

Toggles the high/low state of the specified pin.

**Availability:**

All devices.

**Requires:**

Pin constants are defined in the devices .h file

**Examples:**

```c
output_toggle(PIN_B4);
```

**Example Files:**

None

**Also See:**

Input(), output_high(), output_low(), output_bit(), output_x()

## perror( )

**Syntax:**

```c
perror(string);
```

**Parameters:**

- `string` is a constant string or array of characters (null terminated).

**Returns:**

Nothing

**Function:**

This function prints out to STDERR the supplied string and a description of the last system error (usually a math error).

**Availability:**

All devices.

**Requires:**

`#USE RS232, #INCLUDE <errno.h>

```c
x = sin(y);
```

**Examples:**

```c
if(errno!=0)
    perror("Problem in find_area");
```
pid_busy()  

Syntax:  
\[ \text{result} = \text{pid_busy}(); \]

Parameters: None

Returns: TRUE if PID module is busy or FALSE is PID module is not busy.

Function: To check if the PID module is busy with a calculation.

Availability: All devices with a PID module.

Requires: Nothing

Examples:
```c
pid_get_result(PID_START_ONLY, ADCResult);
while(pid_busy());
pid_get_result(PID_READ_ONLY, &PIDResult);
```

Example Files: None

Also See: RS232 I/O Overview

pid_get_result()  

Syntax:  
```c
pid_get_result(set_point, input, &output); //Start and Read
pid_get_result(mode, set_point, input);    //Start Only
pid_get_result(mode, &output)              //Read Only
pid_get_result(mode, set_point, input, &output);
```

Parameters: 
- **mode**: constant parameter specifying whether to only start the calculation, only read the result, or start the calculation and read the result. The options are defined in the device's header file as:
  - PID_START_READ
  - PID_READ_ONLY
  - PID_START_ONLY
set_point - a 16-bit variable or constant representing the set point of the control system, the value the input from the control system is compared against to determine the error in the system.

input - a 16-bit variable or constant representing the input from the control system.

output - a structure that the output of the PID module will be saved to. Either pass the address of the structure as the parameter, or a pointer to the structure as the parameter.

Returns: Nothing

Function: To pass the set point and input from the control system to the PID module, start the PID calculation and get the result of the PID calculation. The PID calculation starts, automatically when the input is written to the PID module's input registers.

Availability: All devices with a PID module.

Requires: Constants are defined in the device's .h file.

Examples:

```c
pid_get_result(SetPoint, ADCResult, &PIDOutput);
    //Start and Read
pid_get_result(PID_START_ONLY, SetPoint, ADCResult);
    //Start Only
pid_get_result(PID_READ_ONLY, &PIDResult);
    //Read Only
```

Example Files: None

Also See: setup_pid(), pid_read(), pid_write(), pid_busy()

### pid_read( )

Syntax: `pid_read(register, &output);`

Parameters: `register` - constant specifying which PID registers to read. The registers that can be written are defined in the device's header file as:

- PID_ADDR_ACCUMULATOR
- PID_ADDR_OUTPUT
- PID_ADDR_Z1
- PID_ADDR_Z2
### pid_read()

**Syntax:**
```c
pid_read(register, &input);
```

**Parameters:**
- `register` - constant specifying which PID registers to read. The registers that can be read are defined in the device's header file as:
  - `PID_ADDR_ACCUMULATOR`
  - `PID_ADDR_OUTPUT`
  - `PID_ADDR_Z1`
  - `PID_ADDR_Z2`
  - `PID_ADDR_Z3`
  - `PID_ADDR_K1`
  - `PID_ADDR_K2`
  - `PID_ADDR_K3`

- `input` - a 16-bit variable, 32-bit variable or structure that specified PID registers value will be saved to. The size depends on the registers that are being read. Either pass the address of the variable or structure as the parameter, or a pointer to the variable or structure as the parameter.

**Returns:**
Nothing

**Function:**
To read the current value of the Accumulator, Output, Z1, Z2, Set Point, K1, K2 or K3 PID registers. If the PID is busy with a calculation the function will wait for module to finish calculation before reading the specified register.

**Availability:**
All devices with a PID module.

**Requires:**
Constants are defined in the device's .h file.

**Examples:**
```c
pid_read(PID_ADDR_Z1, &value_z1);
```

**Example Files:**
None

**Also See:**
`setup_pid()`, `pid_write()`, `pid_get_result()`, `pid_busy()`

---

### pid_write()

**Syntax:**
```c
pid_write(register, &input);
```

**Parameters:**
- `register` - constant specifying which PID registers to write. The registers that can be written are defined in the device's header file as:
  - `PID_ADDR_ACCUMULATOR`
  - `PID_ADDR_OUTPUT`
  - `PID_ADDR_Z1`
  - `PID_ADDR_Z2`
  - `PID_ADDR_Z3`
  - `PID_ADDR_K1`
  - `PID_ADDR_K2`
  - `PID_ADDR_K3`

- `input` - a 16-bit variable, 32-bit variable or structure that contains
Built-in Functions

the data to be written. The size depends on the registers that are being written. Either pass the address of the variable or structure as the parameter, or a pointer to the variable or structure as the parameter.

**Returns:** Nothing

**Function:** To write a new value for the Accumulator, Output, Z1, Z2, Set Point, K1, K2 or K3 PID registers. If the PID is busy with a calculation the function will wait for module to finish the calculation before writing the specified register.

**Availability:** All devices with a PID module.

**Requires:** Constants are defined in the device's .h file.

**Examples:**

```c
pid_write(PID_ADDR_Z1, &value_z1);
```

**Example Files:** None

**Also See:** setup_pid(), pid_read(), pid_get_result(), pid_busy()

---

**pll_locked()**

**Syntax:** `result=pll_locked();`

**Parameters:** None

**Returns:** A short int. TRUE if the PLL is locked/ready, FALSE if PLL is not locked/ready

**Function:** This function allows testing the PLL Ready Flag bit to determined if the PLL is stable and running.

**Availability:** Devices with a Phase Locked Loop (PLL). Not all devices have a PLL Ready Flag, for those devices the pll_locked() function will always return TRUE.

**Requires:** Nothing.

**Examples:**

```c
while(!pll_locked());
```
### port_x_pullups ( )

#### Syntax:
```c
port_a_pullups (value)
port_b_pullups (value)
port_d_pullups (value)
port_e_pullups (value)
port_j_pullups (value)
port_x_pullups (upmask)
port_x_pullups (upmask, downmask)
```

#### Parameters:
- `value` is TRUE or FALSE on most parts, some parts that allow pullups to be specified on individual pins permit an 8 bit int here, one bit for each port pin.
- `upmask` for ports that permit pullups to be specified on a pin basis. This mask indicates what pins should have pullups activated. A 1 indicates the pullups is on.
- `downmask` for ports that permit pulldowns to be specified on a pin basis. This mask indicates what pins should have pulldowns activated. A 1 indicates the pulldowns is on.

#### Returns:
undefined

#### Function:
Sets the input pullups. TRUE will activate, and a FALSE will deactivate.

#### Availability:
Only 14 and 16 bit devices (PCM and PCH). (Note: use SETUP_COUNTERS on PCB parts).

#### Requires:
Nothing

#### Examples:
```c
port_a_pullups(FALSE);
```

#### Example Files:
- `ex_lcdkb.c`
- `kbd.c`

#### Also See:
- `input()`, `input_x()`, `output_float()`
### pow( ) pwr( )

**Syntax:**

\[
f = \text{pow}(x, y) \\
f = \text{pwr}(x, y)
\]

**Parameters:**

- \(x\) and \(y\) are of type float

**Returns:**

A float

**Function:** Calculates \(X\) to the \(Y\) power.

Note on error handling:

If "errno.h" is included then the domain and range errors are stored in the errno variable. The user can check the errno to see if an error has occurred and print the error using the perror function.

Range error occurs in the following case:
- \(\text{pow}\): when the argument \(X\) is negative

**Availability:** All Devices

**Requires:** 

\`
#include <math.h>
\`

**Examples:**

\[
\text{area} = \text{pow} (\text{size}, 3.0);
\]

**Example Files:** None

**Also See:** None

### printf( ) fprintf( )

**Syntax:**

\[
\text{printf}(\text{string}) \\
\text{or}
\text{printf}(\text{cstring, values}...) \\
\text{or}
\text{printf}(\text{fname, cstring, values}...) \\
\text{fprintf}(\text{stream, cstring, values}...)
\]

**Parameters:**

- \(\text{String}\) is a constant string or an array of characters null terminated.

- \(\text{C String}\) is a constant string. Note that format specifiers cannot be used in RAM strings.

- \(\text{Values}\) is a list of variables separated by commas, \(\text{fname}\) is a
function name to be used for outputting (default is putc is none is specified.)

**Stream** is a stream identifier (a constant byte).

**Returns:** undefined

**Function:** Outputs a string of characters to either the standard RS-232 pins (first two forms) or to a specified function. Formatting is in accordance with the string argument. When variables are used this string must be a constant. The % character is used within the string to indicate a variable value is to be formatted and output. Longs in the printf may be 16 or 32 bit. A %% will output a single %. Formatting rules for the % follows.

See the Expressions > Constants and Trigraph sections of this manual for other escape character that may be part of the string.

If fprintf() is used then the specified stream is used where printf() defaults to STDOUT (the last USE RS232).

**Format:**
The format takes the generic form %nt. n is optional and may be 1-9 to specify how many characters are to be outputted, or 01-09 to indicate leading zeros, or 1.1 to 9.9 for floating point and %w output. t is the type and may be one of the following:

<table>
<thead>
<tr>
<th>c</th>
<th>Character</th>
</tr>
</thead>
<tbody>
<tr>
<td>s</td>
<td>String or character</td>
</tr>
<tr>
<td>u</td>

</table>

* Result is undefined - Assume garbage.

Availability: All Devices

Requires: #USE RS232 (unless fname is used)

Examples:
```c
byte x, y, z;
printf("HiThere");
printf("RTCCValue=>%2x\n", get_rtcc());
printf("%2u %X %4X\n", x, y, z);
printf(LCD_PUTC, "n=%u", n);
```

Example Files: ex_admm.c, ex_lcdkb.c

Also See: atoi(), puts(), putc(), getc() (for a stream example), RS232 I/O Overview

profileout()

Syntax:
```c
profileout(string);
profileout(string, value);
profileout(value);
```

Parameters:
string is any constant string, and value can be any constant or variable integer. Despite the length of string the user specifies here, the code profile run-time will actually only send a one or two byte identifier tag to the code profile tool to keep transmission and execution time to a minimum.

Returns: Undefined

Function:
Typically the code profiler will log and display function entry and exits, to show the call sequence and profile the execution time of the functions. By using profileout(), the user can add any message or display any variable in the code profile tool. Most messages sent by profileout() are displayed in the 'Data
Messages' and 'Call Sequence' screens of the code profile tool.
If a profileout(string) is used and the first word of string is "START", the code profile tool will then measure the time it takes until it sees the same profileout(string) where the "START" is replaced with "STOP". This measurement is then displayed in the 'Statistics' screen of the code profile tool, using string as the name (without "START" or "STOP")

Availability:
Any device.

Requires:  
#use profile() used somewhere in the project source code.

Examples:
// send a simple string.
profileout("This is a text string");
// send a variable with a string identifier.
profileout("RemoteSensor=", adc);
// just send a variable.
profileout(adc);

Examples:
// time how long a block of code takes to execute.
// this will be displayed in the 'Statistics' of the
// Code Profile tool.
profileout("start my algorithm");
/* code goes here */
profileout("stop my algorithm");

Example Files:  
ex_profile.c

Also See:   
#use profile(), #profile, Code Profile overview

psmc_blanking( )

Syntax:  
psmc_blanking(unit, rising_edge, rise_time, falling_edge, fall_time);

Parameters:  
unit is the PSMC unit number 1-4

rising_edge are the events that are ignored after the signal activates.

rise_time is the time in ticks (0-255) that the above events are ignored.
### falling_edge

*falling_edge* are the events that are ignored after the signal goes inactive.

### fall_time

*fall_time* is the time in ticks (0-255) that the above events are ignored.

#### Events:

- PSMC_EVENT_C1OUT
- PSMC_EVENT_C2OUT
- PSMC_EVENT_C3OUT
- PSMC_EVENT_C4OUT
- PSMC_EVENT_IN_PIN

#### Returns:

undefined

#### Function:

This function is used when system noise can cause an incorrect trigger from one of the specified events. This function allows for ignoring these events for a period of time around either edge of the signal. See setup_psmc() for a definition of a tick.

Pass a 0 or FALSE for the events to disable blanking for an edge.

#### Availability:

All devices equipped with PSMC module.

#### Requires:

None

#### Examples:

None

#### Example Files:

None

#### Also See:

- setup_psmc()
- psmc_deadband()
- psmc_sync()
- psmc_modulation()
- psmc_shutdown()
- psmc_duty()
- psmc_freq_adjust()
# psmc_deadband()

**Syntax:**

```c
psmc_deadband(unit, rising_edge, falling_edge);
```

**Parameters:**

- `unit` is the PSMC unit number 1-4
- `rising_edge` is the deadband time in ticks after the signal goes active. If this function is not called, 0 is used.
- `falling_edge` is the deadband time in ticks after the signal goes inactive. If this function is not called, 0 is used.

**Returns:**

undefined

**Function:**

This function sets the deadband time values. Deadbands are a gap in time where both sides of a complementary signal are forced to be inactive. The time values are in ticks. See `setup_psmc()` for a definition of a tick.

**Availability:**

All devices equipped with PSMC module.

**Requires:**

undefined

**Examples:**

```c
// 5 tick deadband when the signal goes active.
psmc_deadband(1, 5, 0);
```

**Example Files:**

None

**Also See:**

`setup_psmc()`, `psmc_sync()`, `psmc_blanking()`, `psmc_modulation()`, `psmc_shutdown()`, `psmc_duty()`, `psmc_freq_adjust()`, `psmc_pins()`

---

# psmc_duty()

**Syntax:**

```c
psmc_duty(unit, pins_used, pins_active_low);
```

---

260
**Built-in Functions**

---

**Parameters:**  
*unit* is the PSMC unit number 1-4

*fall_time* is the time in ticks that the signal goes inactive (after the start of the period) assuming the event PSMC_EVENT_TIME has been specified in the setup_psmc().

**Returns:**  
Undefined

**Function:**  
This function changes the fall time (within the period) for the active signal. This can be used to change the duty of the active pulse. Note that the time is NOT a percentage nor is it the time the signal is active. It is the time from the start of the period that the signal will go inactive. If the rise_time was set to 0, then this time is the total time the signal will be active.

**Availability:**  
All devices equipped with PSMC module.

**Requires:**

```
// For a 10khz PWM, based on Fosc divided by 1
// the following sets the duty from
// 0% to 100% baed on the ADC reading
while(TRUE) {
    psmc_duty(1, (read_adc()*(int16)10)/25)*
        (getenv("CLOCK")/1000000));
}
```

**Examples:**

None

**Also See:**

setup_psmc(), psmc_deadband(), psmc_sync(), psmc_blanking(), psmc_modulation(), psmc_shutdown(), psmc_freq_adjust(), psmc_pins()

---

**psmc_freq_adjust( )**

**Syntax:**

```
psmc_freq_adjust(unit, freq_adjust);
```

**Parameters:**  
*unit* is the PSMC unit number 1-4

*freq_adjust* is the time in tick/16 increments to add to the period. The value may be 0-15.

**Returns:**  
Undefined
Function: This function adds a fraction of a tick to the period time for some modes of operation.

Availability: All devices equipped with PSMC module.

Requires: 

Examples: 

Example Files: None

Also See: setup_psmc(), psmc_deadband(), psmc_sync(), psmc_blanking(), psmc_modulation(), psmc_shutdown(), psmc_duty(), psmc_pins()

psmc_modulation( )

Syntax: psmc_modulation(unit, options);

Parameters: unit is the PSMC unit number 1-4

Options may be one of the following:

- PSMC_MOD_OFF
- PSMC_MOD_ACTIVE
- PSMC_MOD_INACTIVE
- PSMC_MOD_C1OUT
- PSMC_MOD_C2OUT
- PSMC_MOD_C3OUT
- PSMC_MOD_C4OUT
- PSMC_MOD_CCP1
- PSMC_MOD_CCP2
- PSMC_MOD_IN_PIN

The following may be OR'ed with the above

- PSMC_MOD_INVERT
- PSMC_MOD_NOT_BDF
- PSMC_MOD_NOT_ACE

Returns: undefined
**Function:**

This function allows some source to control if the PWM is running or not. The active/inactive are used for software to control the modulation. The other sources are hardware controlled modulation. There are also options to invert the inputs, and to ignore some of the PWM outputs for the purpose of modulation.

**Availability:**

All devices equipped with PSMC module.

**Requires:**

None

**Example Files:**

None

**Also See:**

`setup_psmc()`, `psmc_deadband()`, `psmc_sync()`, `psmc_blanking()`, `psmc_shutdown()`, `psmc_duty()`, `psmc_freq_adjust()`, `psmc_pins()`

---

**psmc_pins( )**

**Syntax:**

```
psmc_pins(unit, pins_used, pins_active_low);
```

**Parameters:**

- `unit` is the PSMC unit number 1-4
- `used_pins` is the any combination of the following or'ed together:
  - PSMC_A
  - PSMC_B
  - PSMC_C
  - PSMC_D
  - PSMC_E
  - PSMC_F
  - PSMC_ON_NEXT_PERIOD

If the last constant is used, all the changes made take effect on the next period (as opposed to immediate)

- `pins_active_low` is an optional parameter. When used it lists the same pins from above as the pins that should have an inverted polarity.

**Returns:**

Undefined
**Function:**

This function identified the pins allocated to the PSMC unit, the polarity of those pins and it enables the PSMC unit. The tri-state register for each pin is set to the output state.

**Availability:**

All devices equipped with PSMC module.

**Requires:**

// Simple PWM, 10kHz out on pin C0 assuming a 20mhz crystal
// Duty is initially set to 25%
setup_psmc(1, PSMC)SINGLE,
    PSMC_EVENT_TIME | PSMC_SOURCE_FOSC, us(100,
    PSMC_EVENT_TIME, 0,
    PSMC_EVENT_TIME, us(25));

psmc_pins(1, PSMC_A);

**Examples:**

```
Example Files: None

Also See:
setup_psmc(), psmc_deadband(), psmc_sync(), psmc_blanking(),
psmc_modulation(), psmc_shutdown(), psmc_duty(),
psmc_freq_adjust()
```

---

**psmc_shutdown( )**

**Syntax:**

```c
psmc_shutdown(unit, options, source, pins_high);
psmc_shutdown(unit, command);
```

**Parameters:**

- `unit` is the PSMC unit number 1-4

**Options** may be one of the following:

- PSMC_SHUTDOWN_OFF
- PSMC_SHUTDOWN_NORMAL
- PSMC_SHUTDOWN_AUTO_RESTART

**command** may be one of the following:

- PSMC_SHUTDOWN_RESTART
- PSMC_SHUTDOWN_FORCE
- PSMC_SHUTDOWN_CHECK

**source** may be any of the following or 'ed together:

- PSMC_SHUTDOWN_C1OUT
### Built-in Functions

- PSMC_SHUTDOWN_C2OUT
- PSMC_SHUTDOWN_C3OUT
- PSMC_SHUTDOWN_C4OUT
- PSMC_SHUTDOWN_IN_PIN

**pins_high** is any combination of the following or'ed together:

- PSMC_A
- PSMC_B
- PSMC_C
- PSMC_D
- PSMC_E
- PSMC_F

**Returns:**
Non-zero if the unit is now in shutdown.

**Function:**
This function implements a shutdown capability. When any of the listed events activate the PSMC unit will shutdown and the output pins are driven low unless they are listed in the pins that will be driven high.

The auto restart option will restart when the condition goes inactive, otherwise a call with the restart command must be used. Software can force a shutdown with the force command.

**Availability:**
All devices equipped with PSMC module.

**Requires:**

**Examples:**

**Example Files:**
None

**Also See:**
setup_psmc(), psmc_deadband(), psmc_sync(), psmc_blanking(), psmc_modulation(), psmc_duty(), psmc_freq_adjust(), psmc_pins()
**psmc_sync( )**

**Syntax:**

```c
psmc_sync(slave_unit, master_unit, options);
```

**Parameters:**

- `slave_unit` is the PSMC unit number 1-4 to be controlled.
- `master_unit` is the PSMC unit number 1-4 to be synchronized to.

Options may be:

- `PSMC_SOURCE_IS_PHASE`
- `PSMC_SOURCE_IS_PERIOD`
- `PSMC_DISCONNECT`

The following may be OR'ed with the above:

- `PSMC_INVERT_DUTY`
- `PSMC_INVET_PERIOD`

**Returns:**

`undefined`

**Function:**

This function allows one PSMC unit (the slave) to be synchronized (the outputs) with another PSMC unit (the master).

**Availability:**

All devices equipped with PSMC module.

**Requires:**

None

**Examples:**

**Example Files:**

None

**Also See:**

- `setup_psmc()`, `psmc_deadband()`, `psmc_sync()`, `psmc_modulation()`, `psmc_shutdown()`, `psmc_duty()`, `psmc_freq_adjust()`, `psmc_pins()`
### Built-in Functions

#### psp_output_full()  psp_input_full()  psp_overflow()

**Syntax:**
- `result = psp_output_full()`
- `result = psp_input_full()`
- `result = psp_overflow()`
- `result = psp_error();` // EPMP only
- `result = psp_timeout();` // EPMP only

**Parameters:** None

**Returns:** A 0 (FALSE) or 1 (TRUE)

**Function:** These functions check the Parallel Slave Port (PSP) for the indicated conditions and return TRUE or FALSE.

**Availability:** This function is only available on devices with PSP hardware on chips.

**Requires:** Nothing

**Examples:**
```c
while (psp_output_full())
psp_data = command;
while(!psp_input_full())
if ( psp_overflow() )
  error = TRUE;
else
  data = psp_data;
```

**Example Files:** `ex_psp.c`

**Also See:** `setup_psp()`, `PSP Overview`

---

#### putc()  putchar()  fputc()

**Syntax:**
- `putc (cdata)`
- `putchar (cdata)`
- `fputc(cdata, stream)`

**Parameters:**
- `cdata` is a 8 bit character.
- `Stream` is a stream identifier (a constant byte)

**Returns:** undefined
**Function:**
This function sends a character over the RS232 XMIT pin. A #USE RS232 must appear before this call to determine the baud rate and pin used. The #USE RS232 remains in effect until another is encountered in the file.

If fputc() is used then the specified stream is used whereputc() defaults to STDOOUT (the last USE RS232).

**Availability:**
All devices

**Requires:**
#USE RS232

**Examples:**
```c
putc('*');
for(i=0; i<10; i++)
    putc(buffer[i]);
putc(13);
```

**Example Files:**
ex_tgetc.c

**Also See:**
getc(), printf(), #USE RS232, RS232 I/O Overview

---

### putc_send( ) ; fputc_send( ) ;

**Syntax:**
```c
putc_send();
fputc_send(stream);
```

**Parameters:**

<table>
<thead>
<tr>
<th>stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter specifying the stream defined in #USE RS232.</td>
</tr>
</tbody>
</table>

**Returns:**

<table>
<thead>
<tr>
<th>Nothing</th>
</tr>
</thead>
</table>

**Function:**
Function used to transmit bytes loaded in transmit buffer over RS232. Depending on the options used in #USE RS232 controls if function is available and how it works.

- If using hardware UARTx with NOTXISR option it will check if currently transmitting. If not transmitting it will then check for data in transmit buffer. If there is data in transmit buffer it will load next byte from transmit buffer into the hardware TX buffer, unless using CTS flow control option. In that case it will first check to see if CTS line is at its active state before loading next byte from transmit buffer into the hardware TX buffer.

- If using hardware UARTx with TXISR option, function only available if using CTS flow control option, it will test to see if the TBEx interrupt is enabled. If not enabled it will then test for data in transmit buffer to send. If there is data to send it will then test the
CTS flow control line and if at its active state it will enable the TBEx interrupt. When using the TXISR mode the TBEx interrupt takes care off moving data from the transmit buffer into the hardware TX buffer.

If using software RS232, only useful if using CTS flow control, it will check if there is data in transmit buffer to send. If there is data it will then check the CTS flow control line, and if at its active state it will clock out the next data byte.

### Availability:
All devices

### Requires:
#USE RS232

### Examples:
```c
USE_RS232(UART1, BAUD=9600, TRANSMIT_BUFFER=50, NO_TXISR)
printf("Testing Transmit Buffer");
while(TRUE){
    putc_send();
}
```

### Example Files:
None

### Also See:
_USE_RS232(), RCV_BUFFER_FULL(), TX_BUFFER_FULL(), TX_BUFFER_BYTES(), GET(), PUTC(), PRINTF(), SETUP_UART(), PUTC()_SEND

---

### puts( )

**Syntax:**
```c
puts (string).
fputs (string, stream)
```

**Parameters:**
- `string` is a constant string or a character array (null-terminated).
- `Stream` is a stream identifier (a constant byte)

**Returns:**
undefined

**Function:**
Sends each character in the string out the RS232 pin using putc(). After the string is sent a CARRIAGE-RETURN (13) and LINE-FEED (10) are sent. In general printf() is more useful than puts().

If fputs() is used then the specified stream is used where puts() defaults to STDOUT (the last USE RS232)

**Availability:**
All devices

**Requires:**
#USE RS232
### pwm_off()

**Syntax:**

```
pwm_off([stream]);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in `#USE PWM`.

**Returns:**

Nothing.

**Function:**

To turn off the PWM signal.

**Availability:**

All devices.

**Requires:**

`#USE PWM`

```
#USE PWM(OUTPUT=PIN_C2, FREQUENCY=10kHz, DUTY=25)
while(TRUE){
    if(kbhit()){
        c = getc();
        if(c=='F')
            pwm_off();
    }
}
```

**Example Files:**

None

**Also See:**

`#use_pwm`, `pwm_on()`, `pwm_set_duty_percent()`,
`pwm_set_duty()`, `pwm_set_frequency()`

---

### pwm_on()

**Syntax:**

```
pwm_on([stream]);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in `#USE PWM`.

**Returns:**

Nothing.
## Built-in Functions

<table>
<thead>
<tr>
<th>Function:</th>
<th>To turn on the PWM signal.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability:</td>
<td>All devices.</td>
</tr>
<tr>
<td>Requires:</td>
<td>#USE PWM</td>
</tr>
</tbody>
</table>

```c
#include <pwm.h>

void pwm_on();
```

```c
#define PWM_PIN_C2
#define PWM_FREQUENCY 10000
#define PWM_DUTY 25

int main() {
    while(TRUE) {
        if (kbhit()) {
            char c = getc();
            if (c == 'O')
                pwm_on();
        }
    }
    return 0;
}
```

### PWM Examples

```c
#include <pwm.h>

#define PWM_PIN_C2
#define PWM_FREQUENCY 10000
#define PWM_DUTY 25

int main() {
    while(TRUE) {
        if (kbhit()) {
            char c = getc();
            if (c == 'O')
                pwm_on();
        }
    }
    return 0;
}
```

### PWM Set Duty

**Syntax:**

```
pwm_set_duty([stream], duty);
```

**Parameters:**

- `stream` – optional parameter specifying the stream defined in #USE PWM.
- `duty` – an int16 constant or variable specifying the new PWM high time.

**Returns:**

Nothing.

**Function:**

To change the duty cycle of the PWM signal. The duty cycle percentage depends on the period of the PWM signal. This function is faster than `pwm_set_duty_percent()`, but requires you to know what the period of the PWM signal is.

**Availability:**

All devices.

**Requires:**

#USE PWM

```c
#include <pwm.h>

void pwm_set_duty();
```

**Examples:**

```c
#include <pwm.h>

#define PWM_PIN_C2
#define PWM_FREQUENCY 10000
#define PWM_DUTY 25

int main() {
    while(TRUE) {
        if (kbhit()) {
            char c = getc();
            if (c == 'O')
                pwm_on();
        }
    }
    return 0;
}
```

**Example Files:**

None

### Also See:

- #use_pwm
- pwm_off()
- pwm_set_duty_percent()
- pwm_set_duty()
- pwm_set_frequency()
## pwm_set_duty_percent

**Syntax:**
```
pwm_set_duty_percent([stream]), percent
```

**Parameters:**
- `stream` – optional parameter specifying the stream defined in `#USE PWM`.
- `percent` – an int16 constant or variable ranging from 0 to 1000 specifying the new PWM duty cycle, 0 is 0% and 1000 is 100.0%.

**Returns:**
Nothing.

**Function:**
To change the duty cycle of the PWM signal. Duty cycle percentage is based off the current frequency/period of the PWM signal.

**Availability:**
All devices.

**Requires:**
`#USE PWM`

**Examples:**
```c
USE_PWM(OUTPUT=PIN_C2, FREQUENCY=10kHz, DUTY=25)
pwm_set_duty_percent(500); // set PWM duty cycle to 50%
```

**Example Files:**
None

**Also See:**
`#use_pwm, pwm_on(), pwm_off(), pwm_set_frequency(), pwm_set_duty()`

## pwm_set_frequency

**Syntax:**
```
pwm_set_frequency([stream], frequency);
```

**Parameters:**
- `stream` – optional parameter specifying the stream defined in `#USE PWM`.
- `frequency` – an int32 constant or variable specifying the new PWM frequency.

**Returns:**
Nothing.

**Function:**
To change the frequency of the PWM signal. Warning this may change the resolution of the PWM signal.

**Availability:**
All devices.

**Requires:**
`#USE PWM`
# Built-in Functions

## Examples:

```c
#define PWM(OUTPUT=PIN_C2, FREQUENCY=10kHz, DUTY=25)
pwm_set_frequency(1000);  //set PWM frequency to 1kHz
```

## Example Files:

None

## Also See:

- `#use_pwm`
- `pwm_on()`, `pwm_off()`
- `pwm_set_duty_percent`, `pwm_set_duty()`

### `pwm1_interrupt_active()`

```c
pwm1_interrupt_active()
pwm2_interrupt_active()
pwm3_interrupt_active()
pwm4_interrupt_active()
pwm5_interrupt_active()
pwm6_interrupt_active()
```

## Syntax:

```c
result_pwm1_interrupt_active (interrupt)
result_pwm2_interrupt_active (interrupt)
result_pwm3_interrupt_active (interrupt)
result_pwm4_interrupt_active (interrupt)
result_pwm5_interrupt_active (interrupt)
result_pwm6_interrupt_active (interrupt)
```

## Parameters:

- **`interrupt`** - 8-bit constant or variable. Constants are defined in the device's header file as:
  ```c
  • PWM_PERIOD_INTERRUPT
  • PWM_DUTY_INTERRUPT
  • PWM_PHASE_INTERRUPT
  • PWM_OFFSET_INTERRUPT
  ```

## Returns:

TRUE if interrupt is active. FALSE if interrupt is not active.

## Function:

Tests to see if one of the above PWM interrupts is active, interrupt flag is set.

## Availability:

Devices with a 16-bit PWM module.

## Requires:

Nothing

## Examples:

```c
if(pwm1_interrupt_active(PWM_PERIOD_INTERRUPT))
  clear_pwm1_interrupt(PWM_PERIOD_INTERRUPT);
```
Example Files: 

<table>

---

### qei_get_count( )

**Syntax:**

```c
value = qei_get_count( [type] );
```

**Parameters:**

- `type` - Optional parameter to specify which counter to get, defaults to position counter. Defined in devices .h file as:
  ```c
  QEI_GET_POSITION_COUNT
  QEI_GET_VELOCITY_COUNT
  ```

**Returns:**

The 16-bit value of the position counter or velocity counter.

**Function:**

Reads the current 16-bit value of the position or velocity counter.

**Availability:**

Devices that have the QEI module.

**Requires:**

Nothing.

**Examples:**

```c
value = qei_get_counter(QEI_GET_POSITION_COUNT);
value = qei_get_counter();
value = qei_get_counter(QEI_GET_VELOCITY_COUNT);
```

**Example Files:**

None

**Also See:**

setup_qei(), qei_set_count(), qei_status().

---

### qei_set_count( )

**Syntax:**

```c
qei_set_count( value );
```

**Parameters:**

- `value` - The 16-bit value of the position counter.

**Returns:**

void

**Function:**

Write a 16-bit value to the position counter.

**Availability:**

Devices that have the QEI module.
Built-in Functions

**qei_status()**

**Syntax:**
```
status = qei_status();
```

**Parameters:**
None

**Returns:**
The status of the QEI module.

**Function:**
Returns the status of the QEI module.

**Availability:**
Devices that have the QEI module.

**Requires:**
Nothing.

**Examples:**
```
status = qei_status();
```

**Example Files:**
None

**Also See:**
setup_qei(), qei_get_count(), qei_status().

**qsort()**

**Syntax:**
```
qsort (base, num, width, compare)
```

**Parameters:**
- `base`: Pointer to array of sort data
- `num`: Number of elements
- `width`: Width of elements
- `compare`: Function that compares two elements

**Returns:**
None

**Function:**
Performs the shell-metzner sort (not the quick sort algorithm). The contents of the array are sorted into ascending order according to
a comparison function pointed to by compare.

Availability: All devices

Requires: #INCLUDE <stdlib.h>

Examples:
```c
int nums[5]={ 2,3,1,5,4};
int compar(void *arg1,void *arg2);

void main() {
    qsort ( nums, 5, sizeof(int), compar);
}

int compar(void *arg1,void *arg2) {
    if ( * (int *) arg1 < ( * (int *) arg2) return -1
    else if ( * (int *) arg1 == ( * (int *) arg2)
    return 0
    else return 1;
}
```

Example Files: ex_qsort.c

Also See: bsearch()

### rand( )

**Syntax:** re=rand()

**Parameters:** None

**Returns:** A pseudo-random integer.

**Function:** The rand function returns a sequence of pseudo-random integers in the range of 0 to RAND_MAX.

**Availability:** All devices

**Requires:** #INCLUDE <STDLIB.H>
### Built-in Functions

#### Examples:

```c
int I;
I=rand();
```

#### Example Files:

None

#### Also See:

`srand()`

---

### rcv_buffer_bytes()

#### Syntax:

```c
value = rcv_buffer_bytes([stream]);
```

#### Parameters:

- `stream` – optional parameter specifying the stream defined in `#USE RS232`.

#### Returns:

Number of bytes in receive buffer that still need to be retrieved.

#### Function:

Function to determine the number of bytes in receive buffer that still need to be retrieved.

#### Availability:

All devices

#### Requires:

`#USE RS232`

#### Examples:

```c
#USE_RS232(UART1,BAUD=9600,RECEIVE_BUFFER=100)
void main(void) {
    char c;
    if(rcv_buffer_bytes() > 10)
        c = getc();
}
```

#### Example Files:

None

#### Also See:

`_USE_RS232()`, `RCV_BUFFER_FULL()`, `TX_BUFFER_FULL()`, `TX_BUFFER_BYTES()`, `GETC()`, `PUTC()`, `PRINTF()`, `SETUP_UART()`, `PUTC_SEND()`

---

### rcv_buffer_full()

#### Syntax:

```c
value = rcv_buffer_full([stream]);
```

#### Parameters:

- `stream` – optional parameter specifying the stream defined in `#USE RS232`.

---

277
Returns: TRUE if receive buffer is full, FALSE otherwise.

Function: Function to test if the receive buffer is full.

Availability: All devices

Requires: #USE RS232

Examples:

```c
#USE_RS232(UART1,BAUD=9600,RECEIVE_BUFFER=100)
void main(void) {
    char c;
    if(rcv_buffer_full())
        c = getc();
}
```

Example Files: None

Also See: _USE_RS232(), RCV_BUFFER_BYTES(), TX_BUFFER_BYTES(), TX_BUFFER_FULL(), GETC(), PUTC(), PRINTF(), SETUP_UART(), PUTC_SEND()

---

**read_adc( )**

Syntax: `value = read_adc ([mode])`

Parameters: `mode` is an optional parameter. If used the values may be:
- ADC_START_AND_READ (continually takes readings, this is the default)
- ADC_START_ONLY (starts the conversion and returns)
- ADC_READ_ONLY (reads last conversion result)

Returns: Either a 8 or 16 bit int depending on #DEVICE ADC= directive.

Function: This function will read the digital value from the analog to digital converter. Calls to setup_adc(), setup_adc_ports() and set_adc_channel() should be made sometime before this function is called. The range of the return value depends on number of bits in the chips A/D converter and the setting in the #DEVICE ADC= directive as follows:

<table>
<thead>
<tr>
<th>#DEVICE</th>
<th>8 bit</th>
<th>10 bit</th>
<th>11 bit</th>
<th>12 bit</th>
<th>16 bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC=8</td>
<td>00-FF</td>
<td>00-FF</td>
<td>00-FF</td>
<td>00-FF</td>
<td>00-FF</td>
</tr>
<tr>
<td>ADC=10</td>
<td>x</td>
<td>0-3FF</td>
<td>x</td>
<td>0-3FF</td>
<td>x</td>
</tr>
</tbody>
</table>
### Built-in Functions

<table>
<thead>
<tr>
<th>ADC=1</th>
<th>x</th>
<th>x</th>
<th>0-7FF</th>
<th>x</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ADC=1</td>
<td>0FF</td>
<td>0-</td>
<td>0-</td>
<td>0-</td>
<td>0-FFFF</td>
</tr>
<tr>
<td>6</td>
<td>00</td>
<td>FFC0</td>
<td>FFEO</td>
<td>FFO</td>
<td>FFFF</td>
</tr>
</tbody>
</table>

Note: x is not defined

### Availability:
This function is only available on devices with A/D hardware.

### Requires:
Pin constants are defined in the devices .h file.

```c
setup_adc( ADC_CLOCK_INTERNAL );
setup_adc_ports( ALL_ANALOG );
set_adc_channel(1);
while ( input(PIN_B0) ) {
  delay_ms( 5000 );
  value = read_adc();
  printf("A/D value = %2x\n\r", value);
}
read_adc(ADC_START_ONLY);
sleep();
value=read_adc(ADC_READ_ONLY);
```

### Example Files:
- `ex_admm.c`
- `ex_14kad.c`

### Also See:
- `setup_adc()`, `set_adc_channel()`, `setup_adc_ports()`,
- `#DEVICE`, `ADC Overview`

---

### read_bank()

**Syntax:**

```
value = read_bank (bank, offset)
```

**Parameters:**

- `bank` is the physical RAM bank 1-3 (depending on the device)
- `offset` is the offset into user RAM for that bank (starts at 0),

**Returns:**

8 bit int

**Function:**

Read a data byte from the user RAM area of the specified memory bank. This function may be used on some devices where full RAM access by auto variables is not efficient. For example, setting the pointer size to 5 bits on the PIC16C57 chip will generate the most efficient ROM code. However, auto variables can not be above 1Fh. Instead of going to 8 bit pointers, you can save ROM by using this function to read from the hard-to-reach banks. In this case, the bank may be 1-3 and the offset may be 0-15.
### CCS C Compiler

**Availability:**
All devices but only useful on PCB parts with memory over 1Fh and PCM parts with memory over FFh.

**Requires:**
Nothing

```c
// See write_bank() example to see how we got the data
// Moves data from buffer to LCD
i=0;
do {
c=read_bank(1,i++);
  if(c!=0x13)
    lcd_putc(c);
} while (c!=0x13);
```

**Example Files:**
ex_psp.c

**Also See:**
write_bank(), and the "Common Questions and Answers" section for more information.

---

### read_calibration( )

**Syntax:**
value = read_calibration (n)

**Parameters:**
n is an offset into calibration memory beginning at 0

**Returns:**
An 8 bit byte

**Function:**
The read_calibration function reads location "n" of the 14000-calibration memory.

**Availability:**
This function is only available on the PIC14000.

**Requires:**
Nothing

**Examples:**
fin = read_calibration(16);

**Example Files:**
ex_14kad.c with 14kcal.c

**Also See:**
None
# read_configuration_memory()

**Syntax:**
```
read_configuration_memory([offset], ramPtr, n)
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ramPtr</td>
<td>is the destination pointer for the read results</td>
</tr>
<tr>
<td>count</td>
<td>is an 8 bit integer</td>
</tr>
<tr>
<td>offset</td>
<td>is an optional parameter specifying the offset into configuration memory to start reading from, offset defaults to zero if not used.</td>
</tr>
</tbody>
</table>

**Returns:** undefined

**Function:** For PIC18 Reads $n$ bytes of configuration memory and saves the values to `ramPtr`. For Enhanced16 devices function reads User ID, Device ID and configuration memory regions.

**Availability:** All PIC18 Flash and Enhanced16 devices

**Requires:** Nothing

**Examples:**
```
int data[6];
read_configuration_memory(data, 6);
```

**Example Files:** None

**Also See:** `write_configuration_memory()`, `read_program_memory()`, `Configuration Memory Overview`.

---

# read_eeprom()

**Syntax:**
```
value = read_eeprom(address)
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>is an 8 bit or 16 bit int depending on the part</td>
</tr>
</tbody>
</table>

**Returns:** An 8 bit int

**Function:** Reads a byte from the specified data EEPROM address. The address begins at 0 and the range depends on the part.

**Availability:** This command is only for parts with built-in EEPROMS
read_extended_ram( )

Syntax: read_extended_ram(page,address,data,count);

Parameters: page – the page in extended RAM to read from
address – the address on the selected page to start reading from
data – pointer to the variable to return the data to
count – the number of bytes to read (0-32768)

Returns: Undefined

Function: To read data from the extended RAM of the PIC.

Availability: On devices with more then 30K of RAM.

Requires: Nothing

Examples:
unsigned int8 data[8];
read_extended_ram(1,0x0000,data,8);

Example Files: None

Also See: read_extended_ram(), Extended RAM Overview

read_program_memory( )
read_external_memory( )

Syntax: READ_PROGRAM_MEMORY (address, dataptr, count);
READ_EXTERNAL_MEMORY (address, dataptr, count);

Parameters: address is 16 bits on PCM parts and 32 bits on PCH parts.
least significant bit should always be 0 in PCM.  
*dataptr* is a pointer to one or more bytes.  
*count* is a 8 bit integer on PIC16 and 16-bit for PIC18

**Returns:** undefined

**Function:** Reads *count* bytes from program memory at *address* to RAM at *dataptr*. Both of these functions operate exactly the same.

**Availability:** Only devices that allow reads from program memory.

**Requires:** Nothing

**Examples:**

```c
char buffer[64];
read_external_memory(0x40000, buffer, 64);
```

**Example Files:** None

**Also See:** write program memory(), External memory overview, Program Eeprom Overview

### read_program_eeprom()

**Syntax:**

```c
value = read_program_eeprom (address)
```

**Parameters:**

*address* is 16 bits on PCM parts and 32 bits on PCH parts

**Returns:** 16 bits

**Function:** Reads data from the program memory.

**Availability:** Only devices that allow reads from program memory.

**Requires:** Nothing

**Examples:**

```c
checksum = 0;
for(i=0;i<8196;i++)
    checksum^=read_program_eeprom(i);
printf("Checksum is %2X\n",checksum);
```

**Example Files:** None

**Also See:** write_program_eeprom(), write_eeprom(), read_eeprom(), Program Eeprom Overview
read_rom_memory( )

**Syntax:**
```
READ_ROM_MEMORY (address, dataptr, count);
```

**Parameters:**
- `address` is 32 bits. The least significant bit should always be 0.
- `dataptr` is a pointer to one or more bytes.
- `count` is a 16 bit integer

**Returns:**
undefined

**Function:**
Reads `count` bytes from program memory at `address` to `dataptr`. Due to the 24 bit program instruction size on the PCD devices, three bytes are read from each address location.

**Availability:**
Only devices that allow reads from program memory.

**Requires:**
Nothing

**Examples:**
```
char buffer[64];
read_program_memory(0x40000, buffer, 64);
```

**Example Files:**
None

**Also See:**
`write_program_eeprom()`, `write_eeprom()`, `read_eeprom()`, `Program eeprom overview`

read_sd_adc( )

**Syntax:**
```
value = read_sd_adc();
```

**Parameters:**
None

**Returns:**
A signed 32 bit int.

**Function:**
To poll the SDRDY bit and if set return the signed 32 bit value stored in the SD1RESH and SD1RESL registers, and clear the SDRDY bit. The result returned depends on settings made with the `setup_sd_adc()` function, but will always be a signed int32 value with the most significant bits being meaningful. Refer to Section 66, 16-bit Sigma-Delta A/D Converter, of the PIC24F Family Reference Manual for more information on the module and
Built-in Functions

the result format.

Availability: Only devices with a Sigma-Delta Analog to Digital Converter (SD ADC) module.

Examples: value = read_sd_adc()

Example Files: None

Also See: setup_sd_adc(), set_sd_adc_calibration(), set_sd_adc_channel()

realloc( )

Syntax: realloc (ptr, size)

Parameters: ptr is a null pointer or a pointer previously returned by calloc or malloc or realloc function, size is an integer representing the number of bytes to be allocated.

Returns: A pointer to the possibly moved allocated memory, if any. Returns null otherwise.

Function: The realloc function changes the size of the object pointed to by the ptr to the size specified by the size. The contents of the object shall be unchanged up to the lesser of new and old sizes. If the new size is larger, the value of the newly allocated space is indeterminate. If ptr is a null pointer, the realloc function behaves like malloc function for the specified size. If the ptr does not match a pointer earlier returned by the calloc, malloc or realloc, or if the space has been deallocated by a call to free or realloc function, the behavior is undefined. If the space cannot be allocated, the object pointed to by ptr is unchanged. If size is zero and the ptr is not a null pointer, the object is to be freed.

Availability: All devices

Requires: #INCLUDE <stdlibm.h>

int * iptr;
iptr=malloc(10);
realloc(iptr,20)

Examples: // iptr will point to a block of memory of 20 bytes, if available.

Example Files: None
### release_io()

**Syntax:**

```
release_io();
```

**Parameters:** none

**Returns:** nothing

**Function:** The function releases the I/O pins after the device wakes up from deep sleep, allowing the state of the I/O pins to change.

**Availability:** Devices with a deep sleep module.

**Requires:** Nothing

**Examples:**

```c
unsigned int16 restart;
restart = restart_cause();
if(restart == RTC_FROM_DS)
    release_io();
```

**Example Files:** None

**Also See:** sleep()

### reset_cpu()

**Syntax:**

`reset_cpu()`

**Parameters:** None

**Returns:** This function never returns

**Function:** This is a general purpose device reset. It will jump to location 0 on PCB and PCM parts and also reset the registers to power-up state on the PIC18XXX.

**Availability:** All devices
**Built-in Functions**

<table>
<thead>
<tr>
<th>Requires:</th>
<th>Nothing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples:</td>
<td>if (checksum != 0) reset_cpu();</td>
</tr>
<tr>
<td>Example Files:</td>
<td>None</td>
</tr>
<tr>
<td>Also See:</td>
<td>None</td>
</tr>
</tbody>
</table>

### restart_cause()

**Syntax:**

```c
value = restart_cause()
```

**Parameters:**

None

**Returns:**

A value indicating the cause of the last processor reset. The actual values are device dependent. See the device .h file for specific values for a specific device. Some example values are: WDT_FROM_SLEEP, WDT_TIMEOUT, MCLR_FROM_SLEEP and NORMAL_POWER_UP.

**Function:**

Returns the cause of the last processor reset.

**Availability:**

All devices

**Requires:**

Constants are defined in the devices .h file.

```c
switch ( restart_cause() ) {
  case WDT_FROM_SLEEP:
  case WDT_TIMEOUT:
    handle_error();
}
```

**Example Files:**

`ex_wdt.c`

**Also See:**

`restart_wdt()`, `reset_cpu()`

### restart_wdt()

**Syntax:**

```c
restart_wdt()
```

**Parameters:**

None
Returns: undefined

Function: Restarts the watchdog timer. If the watchdog timer is enabled, this must be called periodically to prevent the processor from resetting.

The watchdog timer is used to cause a hardware reset if the software appears to be stuck.

The timer must be enabled, the timeout time set and software must periodically restart the timer. These are done differently on the PCB/PCM and PCH parts as follows:

<table>
<thead>
<tr>
<th>PCB/PCM</th>
<th>PCH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable/Disable</td>
<td>#fuses</td>
</tr>
<tr>
<td>Timeout time</td>
<td>setup_wdt()</td>
</tr>
<tr>
<td>restart</td>
<td>restart_wdt()</td>
</tr>
<tr>
<td></td>
<td>restart_wdt()</td>
</tr>
</tbody>
</table>

Availability: All devices

Requires: #FUSES

```c
#define WDT #fuses WDT // PCB/PCM example
            // See setup_wdt for a
            // PIC18 example

main() {
    setup_wdt(WDT_2304MS);
    while (TRUE) {
        restart_wdt();
        perform_activity();
    }
}
```

Example Files: ex_wdt.c

Also See: #FUSES, setup_wdt(), WDT or Watch Dog Timer Overview

---

**rotate_left( )**

Syntax: rotate_left(address, bytes)

Parameters: address is a pointer to memory
            bytes is a count of the number of bytes to work with.

Returns: undefined
**Built-in Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Rotates a bit through an array or structure. The address may be an array identifier or an address to a byte or structure (such as &amp;data). Bit 0 of the lowest BYTE in RAM is considered the LSB.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires:</td>
<td>Nothing</td>
</tr>
<tr>
<td>Examples:</td>
<td>x = 0x86; rotate_left( &amp;x, 1); // x is now 0x0d</td>
</tr>
<tr>
<td>Example Files:</td>
<td>None</td>
</tr>
<tr>
<td>Also See:</td>
<td>rotate_right(), shift_left(), shift_right()</td>
</tr>
</tbody>
</table>

---

**rotate_right()**

**Syntax:**

`rotate_right (address, bytes)`

**Parameters:**

*address* is a pointer to memory.  
*bytes* is a count of the number of bytes to work with.

**Returns:**

undefined

**Function:**

Rotates a bit through an array or structure. The address may be an array identifier or an address to a byte or structure (such as &data). Bit 0 of the lowest BYTE in RAM is considered the LSB.

**Availability:**

All devices

**Requires:**

Nothing

**Examples:**

```c
struct {
    int cell_1 : 4;
    int cell_2 : 4;
    int cell_3 : 4;
    int cell_4 : 4; } cells;
rotate_right( &cells, 2);
rotate_right( &cells, 2);
rotate_right( &cells, 2);
rotate_right( &cells, 2);
// cell_1->4, 2->1, 3->2 and 4-> 3
```

**Example Files:**

None
### rtc_alarm_read()

**Syntax:**
```c
rtc_alarm_read(&datetime);
```

**Parameters:**
- `datetime`: A structure that will contain the values to be written to the alarm in the RTCC module. Structure used in read and write functions are defined in the device header file as rtc_time_t.

**Returns:**
- `void`

**Function:**
Reads the date and time from the alarm in the RTCC module to structure `datetime`.

**Availability:**
Devices that have the RTCC module.

**Requires:**
Nothing.

**Examples:**
```c
rtc_alarm_read(&datetime);
```

**Example Files:**
None

**Also See:**
- `rtc_read()`, `rtc_alarm_read()`, `rtc_alarm_write()`, `setup_rtc_alarm()`, `rtc_write()`, `setup_rtc()`

### rtc_alarm_write()

**Syntax:**
```c
rtc_alarm_write(&datetime);
```

**Parameters:**
- `datetime`: A structure that will contain the values to be written to the alarm in the RTCC module. Structure used in read and write functions are defined in the device header file as rtc_time_t.

**Returns:**
- `void`

**Function:**
Writes the date and time to the alarm in the RTCC module as specified in the structure date time.
**rtc_read()**

**Syntax:**
```
rtc_read(&datetime);
```

**Parameters:**
- `datetime`: A structure that will contain the values returned by the RTCC module.

Structure used in read and write functions are defined in the device header file as `rtc_time_t`.

**Returns:**
`void`

**Function:**
Reads the current value of Time and Date from the RTCC module and stores the `datetime` structure.

**Availability:**
Devices that have the RTCC module.

**Requires:**
Nothing.

**Examples:**
```
rtc_read(&datetime);
```

**Example Files:**
- `ex_rtcc.c`

**Also See:**
- `rtc_read()`, `rtc_alarm_read()`, `rtc_alarm_write()`, `setup_rtc_alarm()`, `rtc_write()`, `setup_rtc()`

**rtc_write()**

**Syntax:**
```
rtc_write(&datetime);
```

**Parameters:**
- `datetime`: A structure that will contain the values to be written to
**rtc_write()**

The RTCC module.

Structure used in read and write functions are defined in the device header file as rtc_time_t.

<table>
<thead>
<tr>
<th>Returns:</th>
<th>void</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function:</td>
<td>Writes the date and time to the RTCC module as specified in the structure date time.</td>
</tr>
<tr>
<td>Availability:</td>
<td>Devices that have the RTCC module.</td>
</tr>
<tr>
<td>Requires:</td>
<td>Nothing.</td>
</tr>
<tr>
<td>Examples:</td>
<td>rtc_write(&amp;datetime);</td>
</tr>
<tr>
<td>Example Files:</td>
<td>ex_rtcc.c</td>
</tr>
<tr>
<td>Also See:</td>
<td>rtc_read(), rtc_alarm_read(), rtc_alarm_write(), setup_rtc_alarm(), rtc_write(), setup_rtc()</td>
</tr>
</tbody>
</table>

**rtos_wait()**

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>rtos_wait (exp)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>exp is a logical expression.</td>
</tr>
<tr>
<td>Returns:</td>
<td>None</td>
</tr>
<tr>
<td>Function:</td>
<td>This function can only be used in an RTOS task. This function waits for exp to be true before continuing execution of the rest of the code of the RTOS task. This function allows other tasks to execute while the task waits for exp to be true.</td>
</tr>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires:</td>
<td>#USE RTOS</td>
</tr>
<tr>
<td>Examples:</td>
<td>rtos_wait(kbhit());</td>
</tr>
<tr>
<td>Also See:</td>
<td>None</td>
</tr>
</tbody>
</table>
### rtos_disable( )

The RTOS is only included in the PCW, PCWH, and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>rtos_disable (task)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>task is the identifier of a function that is being used as an RTOS task.</td>
</tr>
<tr>
<td>Returns:</td>
<td>None</td>
</tr>
<tr>
<td>Function:</td>
<td>This function disables a task which causes the task to not execute until enabled by rtos_enable(). All tasks are enabled by default.</td>
</tr>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires:</td>
<td>#USE RTOS</td>
</tr>
<tr>
<td>Examples:</td>
<td>rtos_disable(toggle_green)</td>
</tr>
<tr>
<td>Also See:</td>
<td>rtos enable()</td>
</tr>
</tbody>
</table>

### rtos_enable( )

The RTOS is only included in the PCW, PCWH, and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>rtos_enable (task)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>task is the identifier of a function that is being used as an RTOS task.</td>
</tr>
<tr>
<td>Returns:</td>
<td>None</td>
</tr>
<tr>
<td>Function:</td>
<td>This function enables a task to execute at it's specified rate.</td>
</tr>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires:</td>
<td>#USE RTOS</td>
</tr>
</tbody>
</table>
### rtos_msg_poll()

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>$i = \text{rtos_msg_poll()}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>None</td>
</tr>
<tr>
<td>Returns:</td>
<td>An integer that specifies how many messages are in the queue.</td>
</tr>
<tr>
<td>Function:</td>

### rtos_overrun()

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>$\text{rtos_overrun}(\text{task})$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>$\text{task}$ is an optional parameter that is the identifier of a function that is being used as an RTOS task</td>
</tr>
<tr>
<td>Returns:</td>
<td>A 0 (FALSE) or 1 (TRUE)</td>
</tr>
<tr>
<td>Function:</td>
<td>This function returns TRUE if the specified task took more time to execute than it was allocated. If no task was specified, then it returns TRUE if any task ran over it's alloted execution time.</td>
</tr>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>Requires:</td>
<td><code>#USE RTOS(statistics)</code></td>
</tr>
<tr>
<td>Examples:</td>
<td><code>rtos_overrun()</code></td>
</tr>
<tr>
<td>Also See:</td>
<td>None</td>
</tr>
</tbody>
</table>

### `rtos_run()`

The RTOS is only included in the PCW, PCWH, and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th><code>rtos_run()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td>None</td>
</tr>
<tr>
<td>Returns:</td>
<td>None</td>
</tr>
<tr>
<td>Function:</td>
<td>This function begins the execution of all enabled RTOS tasks. This function controls the execution of the RTOS tasks at the allocated rate for each task. This function will return only when <code>rtos_terminate()</code> is called.</td>
</tr>
<tr>
<td>Availability:</td>
<td>All devices</td>
</tr>
<tr>
<td>Requires:</td>
<td><code>#USE RTOS</code></td>
</tr>
<tr>
<td>Examples:</td>
<td><code>rtos_run()</code></td>
</tr>
<tr>
<td>Also See:</td>
<td><code>rtos_terminate()</code></td>
</tr>
</tbody>
</table>

### `rtos_signal()`

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th><code>rtos_signal (sem)</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters:</td>
<td><code>sem</code> is a global variable that represents the current availability of a shared system resource (a semaphore).</td>
</tr>
</tbody>
</table>
Returns: None

Function: This function can only be used by an RTOS task. This function increments `sem` to let waiting tasks know that a shared resource is available for use.

Availability: All devices

Requires: `#USE RTOS`

Examples: `rtos_signal(uart_use)`

Also See: `rtos wait()`

### rtos_stats()

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

**Syntax:** `rtos_stats(task,&stat)`

**Parameters:**
- `task` is the identifier of a function that is being used as an RTOS task.
- `stat` is a structure containing the following:
  ```c
  struct rtos_stats_struct {
    unsigned int32 task_total_ticks;  //number of ticks the task has
    unsigned int16 task_min_ticks;    //the minimum number of ticks
    unsigned int16 task_max_ticks;    //the maximum number of ticks
    unsigned int16 hns_per_tick;      //us = (ticks*hns_per_tick)/10
  }
  ```

**Returns:** Undefined

**Function:** This function returns the statistic data for a specified `task`.

**Availability:** All devices

**Requires:** `#USE RTOS(statistics)`
**rtos_terminate( )**

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

**Syntax:**

```
rtos_terminate()
```

**Parameters:**

None

**Returns:**

None

**Function:**

This function ends the execution of all RTOS tasks. The execution of the program will continue with the first line of code after the `rtos_run()` call in the program. (This function causes `rtos_run()` to return.)

**Availability:**

All devices

**Requires:**

`#USE RTOS`

**Examples:**

```
rtos_terminate()
```

**Also See:**

`rtos_run()`

---

**rtos_wait( )**

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

**Syntax:**

```
rtos_wait (sem)
```

**Parameters:**

`sem` is a global variable that represents the current availability of a shared system resource (a semaphore).

**Returns:**

None

**Function:**

This function can only be used by an RTOS task. This function waits for `sem` to be greater than 0 (shared resource is available), then decrements `sem` to claim usage of the shared resource and
continues the execution of the rest of the code the RTOS task. This function allows other tasks to execute while the task waits for the shared resource to be available.

<table>
<thead>
<tr>
<th>Availability:</th>
<th>All devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires:</td>
<td>#USE RTOS</td>
</tr>
<tr>
<td>Examples:</td>
<td><code>rtos_wait(uart_use)</code></td>
</tr>
<tr>
<td>Also See:</td>
<td><code>rtos_signal()</code></td>
</tr>
</tbody>
</table>

**rtos_yield( )**

The RTOS is only included in the PCW, PCWH and PCWHD software packages.

**Syntax:**
```
rtos_yield()
```

**Parameters:** None

**Returns:** None

**Function:** This function can only be used in an RTOS task. This function stops the execution of the current task and returns control of the processor to `rtos_run()`. When the next task executes, it will start its execution on the line of code after the `rtos_yield()`.

<table>
<thead>
<tr>
<th>Availability:</th>
<th>All devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires:</td>
<td>#USE RTOS</td>
</tr>
</tbody>
</table>

**Examples:**
```
void yield(void)
{
    printf("Yielding...\r\n");
    rtos_yield();
    printf("Executing code after yield\r\n");
}
```

**Also See:** None
### set_adc_channel()

**Syntax:**

```
set_adc_channel (chan [,neg])
```

**Parameters:**

- `chan` is the channel number to select. Channel numbers start at 0 and are labeled in the data sheet AN0, AN1. For devices with a differential ADC it sets the positive channel to use.

- `neg` is optional and is used for devices with a differential ADC only. It sets the negative channel to use, channel numbers can be 0 to 6 or VSS. If no parameter is used the negative channel will be set to VSS by default.

**Returns:**

undefined

**Function:**

Specifies the channel to use for the next `read_adc()` call. Be aware that you must wait a short time after changing the channel before you can get a valid read. The time varies depending on the impedance of the input source. In general 10us is good for most applications. You need not change the channel before every read if the channel does not change.

**Availability:**

This function is only available on devices with A/D hardware.

**Requires:**

Nothing

**Examples:**

```
set_adc_channel(2);
delay_us(10);
value = read_adc();
```

**Example Files:**

`ex_admm.c`

**Also See:**

`read_adc()`, `setup_adc()`, `setup_adc_ports()`, ADC Overview

### set_adc_trigger()

**Syntax:**

```
set_adc_trigger (trigger)
```

**Parameters:**

- `trigger` - ADC trigger source. Constants defined in device's header, see the device's .h file for all options. Some typical options include:
  - ADC_TRIGGER_DISABLED
  - ADC_TRIGGER_ADACT_PIN
  - ADC_TRIGGER_TIMER1
- **ADC_TRIGGER_CCP1**

  **Returns:** undefined

  **Function:** Sets the Auto-Conversion trigger source for the Analog-to-Digital Converter with Computation (ADC2) Module.

  **Availability:** All devices with an ADC2 Module

  **Requires:** Constants defined in the device's .h file

  **Examples:**

  ```c
  set_adc_trigger(ADC_TRIGGER_TIMER1);
  ```

  **Also See:** ADC Overview, setup_adc(), setup_adc_ports(), set_adc_channel(), read_adc(), #DEVICE, adc_read(), adc_write(), adc_status()
**Built-in Functions**

Also See: setup_adc_reference(), set_adc_channel(), read_adc(), setup_adc(), setup_adc_ports(), ADC Overview

---

**scanf( )**

**Syntax:**
```
scanf(cstring);
scanf(cstring, values...)
fscanf(stream, cstring, values...)
```

**Parameters:**
- `cstring` is a constant string.
- `values` is a list of variables separated by commas.
- `stream` is a stream identifier.

**Returns:** 0 if a failure occurred, otherwise it returns the number of conversion specifiers that were read in, plus the number of constant strings read in.

**Function:** Reads in a string of characters from the standard RS-232 pins and formats the string according to the format specifiers. The format specifier character (%) used within the string indicates that a conversion specification is to be done and the value is to be saved into the corresponding argument variable. A %% will input a single %.

If fscanf() is used, then the specified stream is used, where scanf() defaults to STDIN (the last USE RS232).

**Format:**
The format takes the generic form %nt. `n` is an option and may be 1-99 specifying the field width, the number of characters to be inputted. `t` is the type and maybe one of the following:

- `c` Matches a sequence of characters of the number specified by the field width (1 if no field width is specified). The corresponding argument shall be a pointer to the initial character of an array long enough to accept the sequence.

- `s` Matches a sequence of non-white space characters. The corresponding argument shall be a pointer to the initial character of an array
long enough to accept the sequence and a terminating null character, which will be added automatically.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u</td>
<td>Matches an unsigned decimal integer. The corresponding argument shall be a pointer to an unsigned integer.</td>
</tr>
<tr>
<td>Lu</td>
<td>Matches a long unsigned decimal integer. The corresponding argument shall be a pointer to a long unsigned integer.</td>
</tr>
<tr>
<td>d</td>
<td>Matches a signed decimal integer. The corresponding argument shall be a pointer to a signed integer.</td>
</tr>
<tr>
<td>Ld</td>
<td>Matches a long signed decimal integer. The corresponding argument shall be a pointer to a long signed integer.</td>
</tr>
<tr>
<td>o</td>
<td>Matches a signed or unsigned octal integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Lo</td>
<td>Matches a long signed or unsigned octal integer. The corresponding argument shall be a pointer to a long signed or unsigned integer.</td>
</tr>
<tr>
<td>x or X</td>
<td>Matches a hexadecimal integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Lx or LX</td>
<td>Matches a long hexadecimal integer. The corresponding argument shall be a pointer to a long signed or unsigned integer.</td>
</tr>
<tr>
<td>i</td>
<td>Matches a signed or unsigned integer. The corresponding argument shall be a pointer to a signed or unsigned integer.</td>
</tr>
<tr>
<td>Li</td>
<td>Matches a long signed or unsigned integer. The corresponding argument shall be a pointer to a long signed or unsigned integer.</td>
</tr>
<tr>
<td>f, g or e</td>
<td>Matches a floating point number in decimal or exponential format. The corresponding argument shall be a pointer to a float.</td>
</tr>
</tbody>
</table>
[ ] Matches a non-empty sequence of characters from a set of expected characters. The sequence of characters included in the set are made up of all character following the left bracket (\[) up to the matching right bracket (\]). Unless the first character after the left bracket is a \(^\), in which case the set of characters contain all characters that do not appear between the brackets. If a character is in the set and is not the first or second, where the first is a \(^\), nor the last character, then the set includes all characters from the character before the - to the character after the -.

For example, \%[a-z] would include all characters from a to z in the set and \%[^a-z] would exclude all characters from a to z from the set. The corresponding argument shall be a pointer to the initial character of an array long enough to accept the sequence and a terminating null character, which will be added automatically.

n Assigns the number of characters read thus far by the call to scanf() to the corresponding argument. The corresponding argument shall be a pointer to an unsigned integer.

An optional assignment-suppressing character (*) can be used after the format specifier to indicate that the conversion specification is to be done, but not saved into a corresponding variable. In this case, no corresponding argument variable should be passed to the scanf() function.

A string composed of ordinary non-white space characters is executed by reading the next character of the string. If one of the inputted characters differs from the string, the function fails and exits. If a white-space character precedes the ordinary non-white space characters, then white-space characters are first read in until a non-white space character is read.

White-space characters are skipped, except for the conversion specifiers [ or c, unless a white-space character precedes the [ or c specifiers.

**Availability:** All Devices
set_cog_blanking()

Syntax: set_cog_blanking(falling_time, rising_time);

Parameters: falling time - sets the falling edge blanking time.

rising time - sets the rising edge blanking time.

Returns: Nothing

Function: To set the falling and rising edge blanking times on the Complementary Output Generator (COG) module. The time is based off the source clock of the COG module, the times are either a 4-bit or 6-bit value, depending on the device, refer to the device's datasheet for the correct width.

Availability: All devices with a COG module.

Examples: set_cog_blanking(10,10);

Example Files: None

Also See: setup_cog(), set_cog_phase(), set_cog_dead_band(), cog_status(), cog_restart()
### set_cog_dead_band()

**Syntax:**

```c
set_cog_dead_band(falling_time, rising_time);
```

**Parameters:**

- `falling time` - sets the falling edge dead-band time.
- `rising time` - sets the rising edge dead-band time.

**Returns:**

Nothing

**Function:**

To set the falling and rising edge dead-band times on the Complementary Output Generator (COG) module. The time is based off the source clock of the COG module, the times are either a 4-bit or 6-bit value, depending on the device, refer to the device's datasheet for the correct width.

**Availability:**

All devices with a COG module.

**Examples:**

```c
set_cog_dead_band(16, 32);
```

**Example Files:**

None

**Also See:**

`setup_cog()`, `set_cog_phase()`, `set_cog_blanking()`, `cog_status()`, `cog_restart()`

### set_cog_phase()

**Syntax:**

```c
set_cog_phase(rising_time);
set_cog_phase(falling_time, rising_time);
```

**Parameters:**

- `falling time` - sets the falling edge phase time.
- `rising time` - sets the rising edge phase time.

**Returns:**

Nothing

**Function:**

To set the falling and rising edge phase times on the Complementary Output Generator (COG) module. The time is based off the source clock of the COG module, the times are either a 4-bit or 6-bit value, depending on the device, refer to the device's datasheet for the correct width.
device. Some devices only have a rising edge delay, refer to the device's datasheet.

**Availability:** All devices with a COG module.

**Examples:**
```
set_cog_phase(10,10);
```

**Example Files:** None

**Also See:**
- `setup_cog()`
- `set_cog_dead_band()`
- `set_cog_blanking()`
- `cog_status()`
- `cog_restart()`

### set_compare_time()

**Syntax:**
```
set_compare_time(x, ocr, [ocrs])
```

**Parameters:**
- `x` is 1-16 and defines which output compare module to set time for.
- `ocr` is the compare time for the primary compare register.
- `ocrs` is the optional compare time for the secondary register. Used for dual compare mode.

**Returns:** None

**Function:**
This function sets the compare value for the output compare module. If the output compare module is to perform only a single compare than the `ocr` register is not used. If the output compare module is using double compare to generate an output pulse, the `ocr` signifies the start of the pulse and `ocrs` defines the pulse termination time.

**Availability:**
Only available on devices with output compare modules.

**Requires:** Nothing

```c
// Pin OC1 will be set when timer 2 is equal to 0xF000
setup_timer2(TMR_INTERNAL | TIMER_DIV_BY_8);
set_compare_time(1, 0xF000);
```

**Example Files:** None

**Also See:**
- `get_capture()`
- `setup_compare()`
- Output Compare, PWM Overview
# set_dedicated_adc_channel()

**Syntax:**

```c
set_dedicated_adc_channel(core, channel, [differential]);
```

**Parameters:**

- **core** - the dedicated ADC core to setup
- **channel** - the channel assigned to the specified ADC core.
  Channels are defined in the device’s .h file as follows:
  ```
  • ADC_CHANNEL_AN0
  • ADC_CHANNEL_AN7
  • ADC_CHANNEL_PGA1
  • ADC_CHANNEL_AN0ALT
  • ADC_CHANNEL_AN1
  • ADC_CHANNEL_AN18
  • ADC_CHANNEL_PGA2
  • ADC_CHANNEL_AN1ALT
  • ADC_CHANNEL_AN2
  • ADC_CHANNEL_AN11
  • ADC_CHANNEL_VREF_BAND_GAP
  • ADC_CHANNEL_AN3
  • ADC_CHANNEL_AN15
  ```

Not all of the above defines can be used with all the dedicated ADC cores. Refer to the device’s header for which can be used with each dedicated ADC core.

- **differential** - optional parameter to specify if channel is differential or single-ended. TRUE is differential and FALSE is single-ended.

**Returns:**

Undefined

**Function:**

Sets the channel that will be assigned to the specified dedicated ADC core.

Function does not set the channel that will be read with the next call to `read_adc()`, use `set_adc_channel()` or `read_adc()` functions to set the channel that will be read.

**Availability:**

On the dsPIC33EPxxGSxxx family of devices.

**Requires:**

Nothing.

**Examples:**

```c
setup_dedicated_adc_channel(0, ADC_CHANNEL_AN0);
```

**Example Files:**

None
set_input_level_x()

Syntax:

set_input_level_a(value)
set_input_level_b(value)
set_input_level_v(value)
set_input_level_d(value)
set_input_level_e(value)
set_input_level_f(value)
set_input_level_g(value)
set_input_level_h(value)
set_input_level_j(value)
set_input_level_k(value)
set_input_level_l(value)

Parameters:

value is an 8-bit int with each bit representing a bit of the I/O port.

Returns:

undefined

Function:

These functions allow the I/O port Input Level Control (INLVLx) registers to be set. Each bit in the value represents one pin. A 1 sets the corresponding pin's input level to Schmitt Trigger (ST) level, and a 0 sets the corresponding pin's input level to TTL level.

Availability:

All devices with ODC registers, however not all devices have all I/O ports and not all devices port's have a corresponding ODC register.

Requires:

Nothing

Examples:

set_input_level_a(0x0); //sets PIN_A0 input level to ST and all other PORTA pins to TTL level

Example Files:

None

Also See:

output_high(), output_low(), output_bit(), output_x(), General Purpose I/O

set_nco_inc_value( )

Syntax:

set_nco_inc_value(value);
### Built-in Functions

#### set_nco_inc_value(inc_value)

**Parameters:** value - value to set the NCO increment registers

**Returns:** Undefined

**Function:** Sets the value that the NCO’s accumulator will be incremented by on each clock pulse. The increment registers are double buffered so the new value won’t be applied until the accumulator rolls-over.

**Availability:** On devices with a NCO module.

**Examples:**
```c
set_nco_inc_value(inc_value);  // sets the new increment value
```

**Example Files:** None

**Also See:** setup_nco(), get_nco_accumulator(), get_nco_inc_value()

set_power_pwm_override()

Syntax: set_power_pwm_override(pwm, override, value)

Parameters:
- **pwm** is a constant between 0 and 7
- **Override** is true or false
- **Value** is 0 or 1

Returns: undefined

Function: **pwm** selects which module will be affected.

**Override** determines whether the output is to be determined by the OVDCONS register or the PDC registers. When override is false, the PDC registers determine the output. When override is true, the output is determined by the value stored in OVDCONS.

**Value** determines if pin is driven to its active state or if pin will be inactive. 0 will be driven to its active state, 0 pin will be inactive.

Availability: All devices equipped with PWM.

Requires: None

Examples:

set_power_pwm_override(1, true, 1);  //PWM1 will be overridden to active

set_power_pwm_override(1, false, 0);  //PWM1 will not be overridden

Example Files: None

Also See: setup_power_pwm(), setup_power_pwm_pins(), set_power_pwmX_duty()

set_power_pwmx_duty()

Syntax: set_power_pwmX_duty(duty)
### Parameters:
- $X$ is 0, 2, 4, or 6
- **Duty** is an integer between 0 and 16383.

### Returns:
undefined

### Function:
Stores the value of duty into the appropriate PDCXL/H register. This duty value is the amount of time that the PWM output is in the active state.

### Availability:
All devices equipped with PWM.

### Requires:
None

### Examples:
```c
set_power_pwmx_duty(4000);
```

### Example Files:
None

### Also See:
- `setup_power_pwm()`, `setup_power_pwm_pins()`,
- `set_power_pwm_override()`

### Syntax:
- `set_pwm1_duty(value)`
- `set_pwm2_duty(value)`
- `set_pwm3_duty(value)`
- `set_pwm4_duty(value)`
- `set_pwm5_duty(value)`

### Parameters:
- **value** may be an 8 or 16 bit constant or variable.

### Returns:
undefined

### Function:
Writes the 10-bit value to the PWM to set the duty. An 8-bit value may be used if the most significant bits are not required. The 10 bit value is then used to determine the duty cycle of the PWM signal as follows:
- \[ \text{duty cycle} = \frac{\text{value}}{4 \times (PR2 + 1)} \]

If an 8-bit value is used, the duty cycle of the PWM signal is determined as follows:
- \[ \text{duty cycle} = \frac{\text{value}}{(PR2+1)} \]
Where PR2 is the maximum value timer 2 will count to before toggling the output pin.

### Availability:
This function is only available on devices with CCP/PWM hardware.

### Requires:
None

```c
// For a 20 mhz clock, 1.2 khz frequency,  
// t2DIV set to 16, PR2 set to 200  
// the following sets the duty to 50% (or 416 us).
long duty;
duty = 408; // [408/(4*(200+1))]=0.5=50%
set_pwm1_duty(duty);
```

### Example Files:
- ex_pwm.c

### Also See:
- setup_ccpX()
- set_ccpX_compare_time()
- set_timer_period_ccpX(), set_timer_ccpX()
- get_timer_ccpX(), get_capture_ccpX()
- get_captures32_ccpX()

### Syntax:
- `set_pwm1_offset( )`
- `set_pwm2_offset( )`
- `set_pwm3_offset( )`
- `set_pwm4_offset( )`
- `set_pwm5_offset( )`
- `set_pwm6_offset( )`

### Parameters:
- `value` - 16-bit constant or variable.

### Returns:
undefined.

### Function:
Writes the 16-bit to the PWM to set the offset. The offset is used to adjust the waveform of a slae PWM module relative
to the waveform of a master PWM module.

### Availability:
Devices with a 16-bit PWM module.

### Requires:
Nothing

### Examples:
- `set_pwm1_offset(0x0100);`
- `set_pwm1_offset(offset);`

### Example Files:
- `setup_pwm()`, `set_pwm_duty()`, `set_pwm_period()`,
- `clear_pwm_interrupt()`, `set_pwm_phase()`,
- `enable_pwm_interrupt()`, `disable_pwm_interrupt()`,
- `pwm_interrupt_active()`

### Syntax:

```c
set_pwm1_period( )
set_pwm2_period( )
set_pwm3_period( )
set_pwm4_period( )
set_pwm5_period( )
set_pwm6_period( )
```

### Parameters:
`value` - 16-bit constant or variable.

### Returns:
undefined.

### Function:
Writes the 16-bit to the PWM to set the period. When the PWM module is set-up for standard mode it sets the period of the PWM signal. When set-up for set on match mode, it sets the maximum value at which the phase match can occur. When in toggle on match and center aligned modes it sets the maximum value the PWMxTMR will count to, the actual period of PWM signal will be twice what the period was set to.

### Availability:
Devices with a 16-bit PWM module.

### Requires:
Nothing
**Examples:**

```
set_pwm1_period(0x8000);
set_pwm1_period(period);
```

**Example Files:**

```
setup_pwm(), set_pwm_duty(), set_pwm_phase(),
clear_pwm_interrupt(), set_pwm_offset(),
enable_pwm_interrupt(), disable_pwm_interrupt(),
pwm_interrupt_active()
```

**Also See:**

**set_pwm2_phase( )**  
**set_pwm3_phase( )**  
**set_pwm4_phase( )**  
**set_pwm5_phase( )**  
**set_pwm6_phase( )**

**Syntax:**

```
set_pwm1_phase (value)
set_pwm2_phase (value)
set_pwm3_phase (value)
set_pwm4_phase (value)
set_pwm5_phase (value)
set_pwm6_phase (value)
```

**Parameters:**

`value` - 16-bit constant or variable.

**Returns:**

undefined.

**Function:**

Writes the 16-bit to the PWM to set the phase. When the PWM module is set-up for standard mode the phaes specifies the start of the duty cycle, when in set on match mode it specifies when the output goes high, and when in toggle on match mode it specifies when the output toggles. Phase is not used when in center aligned mode.

**Availability:**

Devices with a 16-bit PWM module.

**Requires:**

Nothing

**Examples:**

```
set_pwm1_phase(0);
set_pwm1_phase(phase);
```

**Example Files:**

```
setup_pwm(), set_pwm_duty(), set_pwm_period(),
clear_pwm_interrupt(),
enable_pwm_interrupt(),
disable_pwm_interrupt(),
pwm_interrupt_active()
```

**Also See:**

```
set_pwm_offset(), enable_pwm_interrupt(),
disable_pwm_interrupt(), pwm_interrupt_active()
```
**set_open_drain_x()**

Syntax:  

- `set_open_drain_a(value)`
- `set_open_drain_b(value)`
- `set_open_drain_v(value)`
- `set_open_drain_d(value)`
- `set_open_drain_e(value)`
- `set_open_drain_f(value)`
- `set_open_drain_g(value)`
- `set_open_drain_h(value)`
- `set_open_drain_j(value)`
- `set_open_drain_k(value)`

Parameters:  

- `value` is an 16-bit int with each bit representing a bit of the I/O port.

Returns:  

- undefined

Function:  

These functions allow the I/O port Open-Drain Control (ODC) registers to be set. Each bit in the value represents one pin. A 1 sets the corresponding pin to act as an open-drain output, and a 0 sets the corresponding pin to act as a digital output.

Availability:  

- All devices with ODC registers, however not all devices have all I/O ports and not all devices port's have a corresponding ODC register.

Requires:  

- Nothing

Examples:  

- `set_open_drain_a(0x0001);` // makes PIN_A0 an open-drain output

Example Files:  

- None

Also See:  

- `output_high()`, `output_low()`, `output_bit()`, `output_x()`, General Purpose I/O

---

**set_rtcc( )**  
**set_timer0( )**  
**set_timer2( )**  
**set_timer3( )**  
**set_timer5( )**  
**set_timer1( )**  
**set_timer4( )**

Syntax:  

- `set_timer0(value)`
- `set_rtcc(value)`
set_timer1(value)
set_timer2(value)
set_timer3(value)
set_timer4(value)
set_timer5(value)

Parameters:
Timers 1 & 5 get a 16 bit int.
Timer 2 and 4 get an 8 bit int.
Timer 0 (AKA RTCC) gets an 8 bit int except on the PIC18XXX
where it needs a 16 bit int.
Timer 3 is 8 bit on PIC16 and 16 bit on PIC18

Returns: undefined

Function: Sets the count value of a real time clock/counter. RTCC and
Timer0 are the same. All timers count up. When a timer reaches
the maximum value it will flip over to 0 and continue counting
(254, 255, 0, 1, 2...)

Availability:
Timer 0 - All devices
Timers 1 & 2 - Most but not all PCM devices
Timer 3 - Only PIC18XXX and some pick devices
Timer 4 - Some PCH devices
Timer 5 - Only PIC18XX31

Requires: Nothing

Examples:
// 20 mhz clock, no prescaler, set timer 0
// to overflow in 35us
set_timer0(81); // 256-(.000035/(4/20000000))

Example Files: ex_pats.c

Also See: set_timer1(), get_timerX() Timer0 Overview, Timer1Overview,
Timer2 Overview, Timer5 Overview

set_ticks( )

Syntax: set_ticks([stream],value);

Parameters: stream – optional parameter specifying the stream defined in
#USE TIMER
**set_ticks()**

**value** — a 8, 16 or 32 bit integer, specifying the new value of the tick timer. (int8, int16 or int32)

**Returns:** void

**Function:** Sets the new value of the tick timer. Size passed depends on the size of the tick timer.

**Availability:** All devices.

**Requires:** #USE TIMER(options)

#USE TIMER(TIMER=1,TICK=1ms,BITS=16,NOISR)

**Examples:**

```c
void main(void) {
    unsigned int16 value = 0x1000;
    set_ticks(value);
}
```

**Example Files:** None

**Also See:** #USE TIMER, get_ticks()

---

**setup_sd_adc_calibration()**

**Syntax:** setup_sd_adc_calibration(model);

**Parameters:** 
- **mode** — selects whether to enable or disable calibration mode for the SD ADC module. The following defines are made in the device's .h file:
  1. SDADC_START_CALIBRATION_MODE
  2. SDADC_END_CALIBRATION_MODE

**Returns:** Nothing

**Function:** To enable or disable calibration mode on the Sigma-Delta Analog to Digital Converter (SD ADC) module. This can be used to determine the offset error of the module, which then can be subtracted from future readings.

**Availability:** Only devices with a SD ADC module.
Examples:

```c
signed int 32 result, calibration;

set_sd_adc_calibration(SDADC_START_CALIBRATION_MODE);
calibration = read_sd_adc();
set_sd_adc_calibration(SDADC_END_CALIBRATION_MODE);

result = read_sd_adc() - calibration;
```

Example Files: None

Also See: `setup_sd_adc()`, `read_sd_adc()`, `set_sd_adc_channel()`

---

### set_sd_adc_channel()

**Syntax:**

```c
setup_sd_adc(channel);
```

**Parameters:**

`channel` - sets the SD ADC channel to read. Channel can be 0 to read the difference between CH0+ and CH0-, 1 to read the difference between CH1+ and CH1-, or one of the following:

1. SDADC_CH1SE_SVSS
2. SDADC_REFERENCE

**Returns:**

Nothing

**Function:**

To select the channel that the Sigma-Delta Analog to Digital Converter (SD ADC) performs the conversion on.

**Availability:**

Only devices with a SD ADC module.

**Examples:**

```c
set_sd_adc_channel(0);
```

**Example Files:** None

**Also See:** `setup_sd_adc()`, `read_sd_adc()`, `set_sd_adc_calibration()`

---

### set_timerA()

**Syntax:**

```c
set_timerA(value);
```

**Parameters:**

An 8 bit integer. Specifying the new value of the timer. (int8)

**Returns:**

undefined
## Built-in Functions

| Function: | Sets the current value of the timer. All timers count up. When a timer reaches the maximum value it will flip over to 0 and continue counting (254, 255, 0, 1, 2, ...). |
| Availability: | This function is only available on devices with Timer A hardware. |
| Requires: | Nothing |
| Examples: | // 20 mhz clock, no prescaler, set timer A to overflow in 35us  
  set_timerA(81); // 256−(.000035/(4/20000000)) |
| Example Files: | none |
| Also See: | get_timerA(), setup_timer_A(), TimerA Overview |

### set_timerB()

| Syntax: | set_timerB(value); |
| Parameters: | An 8 bit integer. Specifying the new value of the timer. (int8) |
| Returns: | undefined |
| Function: | Sets the current value of the timer. All timers count up. When a timer reaches the maximum value it will flip over to 0 and continue counting (254, 255, 0, 1, 2, ...). |
| Availability: | This function is only available on devices with Timer B hardware. |
| Requires: | Nothing |
| Examples: | // 20 mhz clock, no prescaler, set timer B to overflow in 35us  
  set_timerB(81); // 256−(.000035/(4/20000000)) |
| Example Files: | none |
| Also See: | get_timerB(), setup_timer_B(), TimerB Overview |
set_tris_x( )

Syntax:

set_tris_a(value)
set_tris_b(value)
set_tris_c(value)
set_tris_d(value)
set_tris_e(value)
set_tris_f(value)
set_tris_g(value)
set_tris_h(value)
set_tris_j(value)
set_tris_k(value)

Parameters: value is an 8 bit int with each bit representing a bit of the I/O port.

Returns: undefined

Function: These functions allow the I/O port direction (TRI-State) registers to be set. This must be used with FAST_IO and when I/O ports are accessed as memory such as when a # BYTE directive is used to access an I/O port. Using the default standard I/O the built in functions set the I/O direction automatically.

Each bit in the value represents one pin. A 1 indicates the pin is input and a 0 indicates it is output.

Availability: All devices (however not all devices have all I/O ports)

Requires: Nothing

Examples:

SET_TRIS_B( 0x0F );
// B7,B6,B5,B4 are outputs
// B3,B2,B1,B0 are inputs

Example Files: lcd.c

Also See: #USE FAST_IO, #USE FIXED_IO, #USE STANDARD_IO, General Purpose I/O

set_uart_speed( )

Syntax: set_uart_speed(baud, [stream, clock])
**Built-in Functions**

<table>
<thead>
<tr>
<th>Parameters:</th>
<th><strong>baud</strong> is a constant representing the number of bits per second. <strong>stream</strong> is an optional stream identifier. <strong>clock</strong> is an optional parameter to indicate what the current clock is if it is different from the #use delay value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns:</td>
<td>undefined</td>
</tr>
<tr>
<td>Function:</td>
<td>Changes the baud rate of the built-in hardware RS232 serial port at run-time.</td>
</tr>
<tr>
<td>Availability:</td>
<td>This function is only available on devices with a built in UART.</td>
</tr>
<tr>
<td>Requires:</td>
<td>#USE RS232</td>
</tr>
</tbody>
</table>

```plaintext
// Set baud rate based on setting of pins B0 and B1
switch( input_b() & 3 ) {
    case 0 : set_uart_speed(2400); break;
    case 1 : set_uart_speed(4800); break;
    case 2 : set_uart_speed(9600); break;
    case 3 : set_uart_speed(19200); break;
}
```

**Examples:**
**Example Files:** loader.c

Also See: #USE RS232, putc(), getc(), setup uart(), RS232 I/O Overview.

---

**setjmp( )**

**Syntax:** `result = setjmp (env)`

<table>
<thead>
<tr>
<th>Parameters:</th>
<th><strong>env</strong>: The data object that will receive the current environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns:</td>
<td>If the return is from a direct invocation, this function returns 0. If the return is from a call to the longjmp function, the setjmp function returns a nonzero value and it's the same value passed to the longjmp function.</td>
</tr>
<tr>
<td>Function:</td>
<td>Stores information on the current calling context in a data object of type jmp_buf and which marks where you want control to pass on a corresponding longjmp call.</td>
</tr>
</tbody>
</table>

---
### setup_adc(mode)

**Syntax:**

```c
setup_adc ( mode, [ADCRS], [ADRPT]);
set_up_adc2(mode);
```

**Parameters:**

- **mode** - Analog to digital mode. The valid options vary depending on the device. See the devices .h file for all options. Some typical options include:
  - ADC_OFF
  - ADC_CLOCK_INTERNAL
  - ADC_CLOCK_DIV_32

- **ADCRS** - For devices with an analog-to-digital converter with computation (ADC2) module only. Optional parameter used set how much the accumulated value is divided by \(2^{ADCRS}\) in Accumulate, Average and Parse Average modes, and the cut-off frequency in low-pass filter mode.

- **ADRPT** - For devices with an ADC2 module only. Optional parameter used to set the number of samples to be done before performing a threshold comparison in Average, Burst Average and low-pass filter modes.

**Returns:**

undefined

**Function:**

Configures the analog to digital converter.

**Availability:**

Only the devices with built in analog to digital converter.

**Requires:**

Constants are defined in the devices .h file.

```c
setup_adc_ports( ALL_ANALOG );
setup_adc(ADC_CLOCK_INTERNAL);
set_adc_channel( 0 );
value = read_adc();
setup_adc( ADC_OFF );
```
### Built-in Functions

<table>
<thead>
<tr>
<th>Example Files:</th>
<th><code>ex_admm.c</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Also See:</td>
<td><code>setup_adc_ports()</code>, <code>set_adc_channel()</code>, <code>read_adc()</code>, <code>DEVICE</code>, <code>ADC Overview</code>, see header file for device selected</td>
</tr>
</tbody>
</table>

## `setup_adc_ports()`

**Syntax:**

```
setup_adc_ports (value)
setup_adc_ports (ports, reference]
```

**Parameters:**

- **value** - a constant defined in the device's .h file
- **ports** - is a constant specifying the ADC pins to use
- **reference** - is an optional constant specifying the ADC reference to use. By default, the reference voltage are Vss and Vdd

**Returns:**

undefined

**Function:**

Sets up the ADC pins to be analog, digital, or a combination and the voltage reference to use when computing the ADC value. The allowed analog pin combinations vary depending on the chip and are defined by using the bitwise OR to concatenate selected pins together. Check the device include file for a complete list of available pins and reference voltage settings. The constants `ALL_ANALOG` and `NO_ANALOGS` are valid for all chips. Some other example pin definitions are:

- `sAN1 | sAN2` - AN1 and AN2 are analog, remaining pins are digital
- `sAN0 | sAN3` - AN0 and AN3 are analog, remaining pins are digital

**Availability:**

This function is only available on devices with A/D hardware.

This function is only available on devices with built-in A/D converters.

**Requires:**

Constants are defined in the device's .h file.

```c
 // All pins analog (that can be)
 setup_adc_ports(ALL_ANALOG);
```

**Examples:**

```c
 // Pins A0, A1, and A3 are analog and all others are digital.
 // The +5V is used as a reference.
```
setup_adc_ports(RA0_RA1_RA3_ANALOG);
// Pins A0 and A1 are analog. Pin RA3 is used for
// the reference voltage
// and all other pins are digital.

setup_adc_ports(A0_RA1_ANALOGRA3_REF);
// Set all ADC pins to analog mode.

setup_adc_ports(ALL_ANALOG);
// Pins AN0, AN1, and AN3 are analog and
all other pins
are digital.

setup_adc_ports(sAN0|sAN1|sAN3);
// Pins AN0 and AN1 are analog. The VrefL pin and Vdd
are used for
// voltage references.

setup_adc_ports(sAN0|sAN1, VREF_VDD);

Example Files:

ex_admm.c

Also See:

#USE RS232, putc(), getc(), setup uart(), RS232 I/O Overview,

setup_adc_reference()

Syntax: setup_adc_reference(reference)

Parameters: reference - the voltage reference to set the ADC. The valid options
depend on the device, see the device's .h file for all options. Typical
options include:
• VSS_VDD
• VSS_VREF
• VREF_VREF
• VREF_VDD

Returns: undefined

Function: To set the positive and negative voltage reference for the Analog to
Digital Converter (ADC) uses.

Availability: Only on devices with an ADC and has ANSELx, x being the port
letter, registers for setting which pins are analog or digital.

Requires: Nothing
### setup_at()

**Syntax:**

```c
setup_at(settings);
```

**Parameters:**

- `settings` - the setup of the AT module. See the device's header file for all options. Some typical options include:
  - `AT_ENABLED`
  - `AT_DISABLED`
  - `AT_MULTI_PULSE_MODE`
  - `AT_SINGLE_PULSE_MODE`

**Returns:**

Nothing

**Function:** To setup the Angular Timer (AT) module.

**Availability:** All devices with an AT module.

**Requires:** Constants defined in the device's .h file

**Examples:**

```c
setup_at(AT_ENABLED|AT_MULTI_PULSE_MODE|AT_INPUT_ATIN);
```

**Example Files:** None

**Also See:**

- `at_set_resolution()`, `at_get_resolution()`,
- `at_set_missing_pulse_delay()`, `at_get_missing_pulse_delay()`,
- `at_get_period()`, `at_get_phase_counter()`, `at_set_set_point()`,
- `at_get_set_point()`, `at_get_set_point_error()`, `at_enable_interrupts()`,
- `at_disable_interrupts()`, `at_clear_interrupts()`, `at_interrupt_active()`,
- `at_setup_cc()`, `at_set_compare_time()`, `at_get_capture()`,
- `at_get_status()`
**Syntax:**

- `setup_ccp1 (mode)`  or `setup_ccp1 (mode, pwm)`
- `setup_ccp2 (mode)`  or `setup_ccp2 (mode, pwm)`
- `setup_ccp3 (mode)`  or `setup_ccp3 (mode, pwm)`
- `setup_ccp5 (mode)`  or `setup_ccp5 (mode, pwm)`
- `setup_ccp6 (mode)`  or `setup_ccp6 (mode, pwm)`

**Parameters:**

`mode` is a constant. Valid constants are defined in the devices .h file and refer to devices .h file for all options, some options are as follows:

- Disable the CCP: CCP_OFF
- Set CCP to capture mode:
  - `CCP_CAPTURE_FE`  Capture on falling edge
  - `CCP_CAPTURE_RE`  Capture on rising edge
  - `CCP_CAPTURE_DIV_4`  Capture after 4 pulses
  - `CCP_CAPTURE_DIV_16`  Capture after 16 pulses
- Set CCP to compare mode:
  - `CCP_COMPARE_SET_ON_MATCH`  Output high on compare
  - `CCP_COMPARE_CLR_ON_MATCH`  Output low on compare
  - `CCP_COMPARE_INT`  interrupt on compare
  - `CCP_COMPARE_RESET_TIMER`  Reset timer on compare
- Set CCP to PWM mode:
  - `CCP_PWM`  Enable Pulse Width Modulator

Constants used for ECCP modules are as follows:

- `CCP_PWM_H_H`
- `CCP_PWM_H_L`
- `CCP_PWM_L_H`
- `CCP_PWM_L_L`
- `CCP_PWM_FULL_BRIDGE`
- `CCP_PWM_FULL_BRIDGE_REV`
- `CCP_PWM_HALF_BRIDGE`
<table>

</tr>
<tr>
<td>CCP_SHUTDOWN_RESTART</td>
<td>the device restart after a shutdown event</td>
</tr>
<tr>
<td>CCP_DELAY</td>
<td>use the dead-band delay</td>
</tr>
</tbody>
</table>

**Returns:** Undefined

**Function:**
Initialize the CCP. The CCP counters may be accessed using the long variables CCP_1 and CCP_2. The CCP operates in 3 modes. In capture mode it will copy the timer 1 count value to CCP_x when the input pin event occurs. In compare mode it will trigger an action when timer 1 and CCP_x are equal. In PWM mode it will generate a square wave. The PCW wizard will help to set the correct mode and timer settings for a particular application.

**Availability:** This function is only available on devices with CCP hardware.

`pwm` parameter is an optional parameter for chips that includes ECCP module. This parameter allows setting the shutdown time. The value may be 0-255.
### Requires:

Constants are defined in the devices .h file.

```c
setup_ccp1(CCP_CAPTURE_RE);
```

### Examples:

#### Example Files:

- `ex_pwm.c`
- `ex_ccpmp.c`
- `ex_ccp1s.c`

#### Also See:

- `set_pwmX_duty()`, `set_ccpX_compare_time()`,
- `set_timer_period_ccpX()`, `set_timer_ccpX()`, `get_timer_ccpX()`,
- `get_capture_ccpX()`, `get_captures32_ccpX()`

---

### setup_clc1()  
### setup_clc2()  
### setup_clc3()  
### setup_clc4()

#### Syntax:

```c
setup_clc1(mode);
ssetup_clc2(mode);
ssetup_clc3(mode);
ssetup_clc4(mode);
```

#### Parameters:

- **mode** – The mode to setup the Configurable Logic Cell (CLC) module into. See the device's .h file for all options. Some typical options include:
  - CLC_ENABLED
  - CLC_OUTPUT
  - CLC_MODE_AND_OR
  - CLC_MODE_OR_XOR

#### Returns:

Undefined.

#### Function:

Sets up the CLC module to performed the specified logic. Please refer to the device datasheet to determine what each input to the CLC module does for the select logic function.

#### Availability:

On devices with a CLC module.

#### Returns:

Undefined.

#### Examples:

```c
setup_clc1(CLCC_ENABLED | CLC_MODE_AND_OR);
```

#### Example Files:

None

#### Also See:

- `clcx_setup_gate()`, `clcx_setup_input()`
**setup_comparator( )**

**Syntax:**
```
setup_comparator (mode)
```

**Parameters:**
- `mode` is a constant. Valid constants are in the devices .h file refer to devices .h file for valid options. Some typical options are as follows:
  - A0_A3_A1_A2
  - A0_A2_A1_A2
  - NC_NC_A1_A2
  - NC_NC_NC_NC
  - A0_VR_A1_VR
  - A3_VR_A2_VR
  - A0_A2_A1_A2_OUT_ON_A3_A4
  - A3_A2_A1_A2

**Returns:**
- undefined

**Function:**
Sets the analog comparator module. The above constants have four parts representing the inputs: C1-, C1+, C2-, C2+

**Availability:**
This function is only available on devices with an analog comparator.

**Requires**
- Constants are defined in the devices .h file.

```c
// Sets up two independent comparators (C1 and C2),
// C1 uses A0 and A3 as inputs (- and +), and C2
// uses A1 and A2 as inputs
setup_comparator(A0_A3_A1_A2);
```

**Example Files:**
- `ex_comp.c`

**Also See:**
- [Analog Comparator overview](#)

---

**setup_counters( )**

**Syntax:**
```
setup_counters (rtcc_state, ps_state)
```

**Parameters:**
- `rtcc_state` may be one of the constants defined in the devices .h file. For example: RTCC_INTERNAL, RTCC_EXT_L_TO_H or RTCC_EXT_H_TO_L
**ps_state** may be one of the constants defined in the devices .h file.

For example: RTCC_DIV_2, RTCC_DIV_4, RTCC_DIV_8, RTCC_DIV_16, RTCC_DIV_32, RTCC_DIV_64, RTCC_DIV_128, RTCC_DIV_256, WDT_18MS, WDT_36MS, WDT_72MS, WDT_144MS, WDT_288MS, WDT_576MS, WDT_1152MS, WDT_2304MS

**Returns:** undefined

**Function:** Sets up the RTCC or WDT. The rtcc_state determines what drives the RTCC. The PS state sets a prescaler for either the RTCC or WDT. The prescaler will lengthen the cycle of the indicated counter. If the RTCC prescaler is set the WDT will be set to WDT_18MS. If the WDT prescaler is set the RTCC is set to RTCC_DIV_1.

This function is provided for compatibility with older versions. setup_timer_0 and setup_WDT are the recommended replacements when possible. For PCB devices if an external RTCC clock is used and a WDT prescaler is used then this function must be used.

**Availability:** All devices

**Requires:** Constants are defined in the devices .h file.

**Examples:**

```
setup_counters (RTCC_INTERNAL, WDT_2304MS);
```

**Example Files:** None

**Also See:** setup_wdt(), setup_timer 0(), see header file for device selected

---

**setup_cog()**

**Syntax:**

```
setup_cog(mode, [shutdown]);
setup_cog(mode, [shutdown], [sterring]);
```

**Parameters:**

- **mode** - the setup of the COG module. See the device's .h file for all options.
  Some typical options include:
  - COG_ENABLED
  - COG_DISABLED
  - COG_CLOCK_HFINTOSC
### Built-in Functions

- **COG_CLOCK_FOSC**

**shutdown**- the setup for the auto-shutdown feature of COG module. See the device's .h file for all the options. Some typical options include:

- **COG_AUTO_RESTART**
- **COG_SHUTDOWN_ON_C1OUT**
- **COG_SHUTDOWN_ON_C2OUT**

**steering**- optional parameter for steering the PWM signal to COG output pins and/or selecting the COG pins static level. Used when COG is set for steered PWM or synchronous steered PWM modes. Not available on all devices, see the device's .h file if available and for all options. Some typical options include:

- **COG_PULSE_STEERING_A**
- **COG_PULSE_STEERING_B**
- **COG_PULSE_STEERING_C**
- **COG_PULSE_STEERING_D**

**Returns:** undefined

**Function:** Sets up the Complementary Output Generator (COG) module, the auto-shutdown feature of the module and if available steers the signal to the different output pins.

**Availability:** All devices with a COG module.

**Examples:**

```
setup_cog(COG_ENABLED | COG_PWM | COG_FALLING_SOURCE_PWM3 |
COG_RISING_SOURCE_PWM3, COG_NO_AUTO_SHUTDOWN,
COG_PULSE_STEERING_A | COG_PULSE_STEERING_B);
```

**Example Files:** None

**Also See:**

- `set_cog_dead_band()`, `set_cog_phase()`, `set_cog_blanking()`,
- `cog_status()`, `cog_restart()`
## setup_crc( )

### Syntax:
```
setup_crc(polynomial terms)
```

### Parameters:
- **polynomial**: This will setup the actual polynomial in the CRC engine. The power of each term is passed separated by a comma. 0 is allowed, but ignored. The following define is added to the device's header file to enable little-endian shift direction:
  ```
  CRC_LITTLE_ENDIAN
  ```

### Returns:
Nothing

### Function:
Configures the CRC engine register with the polynomial.

### Availability:
Only devices with a built-in CRC module.

### Examples:
- `setup_crc(12, 5);`  // CRC Polynomial is $x^{12} + x^5 + 1$
- `setup_crc(16, 15, 3, 1);`  // CRC Polynomial is $x^{16} + x^{15} + x^3 + x^1 + 1$

### Example Files:
None

### Also See:
- `crc_init()`, `crc_calc()`, `crc_calc8()`

## setup_cwg( )

### Syntax:
```
setup_cwg(mode, shutdown, dead_time_rising, dead_time_falling)
```

### Parameters:
- **mode**: the setup of the CWG module. See the device's .h file for all options. Some typical options include:
  - CWG_ENABLED
  - CWG_DISABLED
  - CWG_OUTPUT_B
  - CWG_OUTPUT_A
- **shutdown**: the setup for the auto-shutdown feature of CWG module. See the device's .h file for all the options. Some typical options
# Built-in Functions

include:

```c
CWG_AUTO_RESTART
CWG_SHUTDOWN_ON|COMP1
CWG_SHUTDOWN_ON_FLT
CWG_SHUTDOWN_ON_CLC2
```

**dead_time_rising** - value specifying the dead time between A and B on the rising edge. (0-63)

**dead_time_rising** - value specifying the dead time between A and B on the falling edge. (0-63)

Returns: undefined

Function: Sets up the CWG module, the auto-shutdown feature of module and the rising and falling dead times of the module.

Availability: All devices with a CWG module.

Examples:

```c
setup_cwg(CWG_ENABLED|CWG_OUTPUT_A|CWG_OUTPUT_B|
CWG_INPUT_PWM1,CWG_SHUTDOWN_ON_FLT,60,30);
```

Example Files: None

Also See: `cwg_status()`, `cwg_restart()`

## setup_dac()

Syntax: `setup_dac(mode);`

Parameters: `mode` - The valid options vary depending on the device. See the devices .h file for all options. Some typical options include:

- DAC_OUTPUT

Returns: undefined

Function: Configures the DAC including reference voltage.
### setup_dac()

| Availability: | Only the devices with built in digital to analog converter. |
| Requires: | Constants are defined in the devices .h file. |
| Examples: | `setup_dac(DAC_VDD | DAC_OUTPUT);`  
`dac_write(value);` |
| Example Files: | None |
| Also See: | `dac_write()`, DAC Overview, See header file for device selected |

### setup_external_memory()

**Syntax:**

```
SETUP_EXTERNAL_MEMORY( mode);
```

**Parameters:**

- `mode` is one or more constants from the device header file OR'ed together.

**Returns:** undefined

**Function:** Sets the mode of the external memory bus.

**Availability:** Only devices that allow external memory.

**Requires:** Constants are defined in the device.h file

**Examples:**

```
setup_external_memory(EXTMEM_WORD_WRITE | EXTMEM_WAIT_0 );
```  
```
setup_external_memory(EXTMEM_DISABLE);
```  

**Example Files:** None

**Also See:** WRITE PROGRAM EEPROM(), WRITE PROGRAM MEMORY(), External Memory Overview

### setup_lcd()

**Syntax:**

```
setup_lcd (mode, prescale, [segments0_31],[segments32_47]);
```

**Parameters:**

- `Mode` may be any of the following constants to enable the LCD and
Built-in Functions

may be or’ed with other constants in the devices *.h file:
- LCD_DISABLE, LCD_STATIC, LCD_MUX12, LCD_MUX13, LCD_MUX14
See the devices .h file for other device specific options.

**Prescale** may be 1-16 for the LCD clock.

**Segments0-31** may be any of the following constants or’ed together when using the PIC16C92X series of chips:
- SEG0_4, SEG5_8, SEG9_11, SEG12_15, SEG16_19, SEG20_26, SEG27_28, SEG29_31
- ALL_LCD_PINS

When using the PIC16F/LF1xxx or PIC18F/LFxxxx series of chips, each of the segments are enabled individually. A value of 1 will enable the segment, 0 will disable it and use the pin for normal I/O operation.

**Segments 32-47** when using a chip with more than 32 segments, this enables segments 32-47. A value 1 will enable the segment, 0 will disable it. Bit 0 corresponds to segment 32 and bit 15 corresponds to segment 47.

**Returns:** undefined.

**Function:** This function is used to initialize the LCD Driver Module on the PIC16C92X and PIC16F/LF193X series of chips.

**Availability:** Only on devices with built-in LCD Driver Module hardware.

**Requires** Constants are defined in the devices *.h file.

```c
· setup_lcd( LCD_MUX14 | LCD_STOP_ON_SLEEP, 2,
     ALL_LCD_PINS );
     // PIC16C92X
· setup_lcd( LCD_MUX13 | LCD_REF_ENABLED |
    LCD_B_HIGH_POWER, 0, 0xFF0429);
     // PIC16F/LF193X - Enables Segments 0, 3, 5,
     10, 16, 17, 18, 19, 20, 21, 22, 23
```

**Example Files:** ex_92lcd.c

**Also See:** lcd_symbol(), lcd_load(), lcd_contrast(), Internal LCD Overview
setup_low_volt_detect( )

Syntax: setup_low_volt_detect(mode)

Parameters: mode may be one of the constants defined in the devices .h file.
- LVD_LVDIN, LVD_45, LVD_42, LVD_40, LVD_38, LVD_36, LVD_35,
- LVD_33, LVD_30, LVD_28, LVD_27, LVD_25, LVD_23, LVD_21,
- LVD_19
One of the following may be or’ed(via |) with the above if high voltage detect is also available in the device
- LVD_TRIGGER_BELOW, LVD_TRIGGER_ABOVE

Returns: undefined

Function: This function controls the high/low voltage detect module in the device. The mode constants specifies the voltage trip point and a direction of change from that point (available only if high voltage detect module is included in the device). If the device experiences a change past the trip point in the specified direction the interrupt flag is set and if the interrupt is enabled the execution branches to the interrupt service routine.

Availability: This function is only available with devices that have the high/low voltage detect module.

Requires Constants are defined in the devices.h file.

Examples:
- setup_low_volt_detect( LVD_TRIGGER_BELOW | LVD_36 );
  This would trigger the interrupt when the voltage is below 3.6 volts

setup_nco( )

Syntax: setup_nco(settings,inc_value)

Parameters: settings- setup of the NCO module. See the device's .h file for all options.
  Some typical options include:
  - NCO_ENABLE
  - NCO_OUTPUT
  - NCO_PULSE_FREQ_MODE
  - NCO_FIXED_DUTY_MODE
### Built-in Functions

**inc_value** - value to increment the NCO 20 bit accumulator by.

<table>
<thead>
<tr>

</tbody>
</table>
**setup_pid( )**

**Syntax:**

```
setup_pid([mode,[K1],[K2],[K3]]);
```

**Parameters:**

- **mode** - the setup of the PID module. The options for setting up the module are defined in the device's header file as:
  - PID_MODE_PID
  - PID_MODE_SIGNED_ADD_MULTIPLY_WITH_ACCUMULATION
  - PID_MODE_SIGNED_ADD_MULTIPLY
  - PID_MODE_UNSIGNED_ADD_MULTIPLY_WITH_ACCUMULATION
  - PID_MODE_UNSIGNED_ADD_MULTIPLY
  - PID_OUTPUT_LEFT_JUSTIFIED
  - PID_OUTPUT_RIGHT_JUSTIFIED

- **K1** - optional parameter specifying the K1 coefficient, defaults to zero if not specified. The K1 coefficient is used in the PID and ADD_MULTIPLY modes. When in PID mode the K1 coefficient can be calculated with the following formula:
  \[ K1 = Kp + Ki \times T + Kd/T \]
  When in one of the ADD_MULTIPLY modes K1 is the multiple value.

- **K2** - optional parameter specifying the K2 coefficient, defaults to zero if not specified. The K2 coefficient is used in the PID mode only and is calculated with the following formula:
  \[ K2 = -(Kp + 2Kd/T) \]

- **K3** - optional parameter specifying the K3 coefficient, defaults to zero if not specified. The K3 coefficient is used in the PID mode, only and is calculated with the following formula:
  \[ K3 = Kd/T \]
  T is the sampling period in the above formulas.

**Returns:**

Nothing

**Function:**

To setup the Proportional Integral Derivative (PID) module, and to set the input coefficients (K1, K2 and K3).

**Availability:**

All devices with a PID module.

**Requires:**

Constants are defined in the device's .h file.

**Examples:**

```
setup_pid(PID_MODE_PID, 10, -3, 50);
```

**Example Files:**

None
setup_pmp(option,address_mask)

Syntax: setup_pmp(options,address_mask);

Parameters: options- The mode of the Parallel Master Port that allows to set the Master Port mode, read-write strobe options and other functionality of the PMPort module. See the device's .h file for all options. Some typical options include:

- PAR_PSP_AUTO_INC
- PAR_CONTINUE_IN_IDLE
- PAR_INTR_ON_RW //Interrupt on read write
- PAR_INC_ADDR //Increment address by 1 every
- PAR_MASTER_MODE_1 //Master Mode 1
- PAR_WAIT4 //4 Tcy Wait for data hold after

address_mask- this allows the user to setup the address enable register with a 16-bit value. This value determines which address lines are active from the available 16 address lines PMA0:PMA15.

Returns: Undefined.

Function: Configures various options in the PMP module. The options are present in the device's .h file and they are used to setup the module. The PMP module is highly configurable and this function allows users to setup configurations like the Slave module, Interrupt options, address increment/decrement options, Address enable bits, and various strobe and delay options.

Availability: Only the devices with a built-in Parallel Master Port module.

Requires: Constants are defined in the device's .h file.

Examples:

```
setup_psp(PAR_ENABLE| //Sets up Master mode with address
PAR_MASTER_MODE_1|PAR_
STOP_IN_IDLE,0x00FF); //lines PMA0:PMA7
```
Example Files: None

Also See: setup_pmp(), pmp_address(), pmp_read(), psp_read(), psp_write(), pmp_write(), psp_output_full(), psp_input_full(), psp_overflow(), pmp_output_full(), pmp_input_full(), pmp_overflow()
See header file for device selected

**setup_psmc()**

**Syntax:**

```c
setup_psmc(unit, mode, period, period_time, rising_edge, rise_time, falling_edge, fall_time);
```

**Parameters:**

- `unit` is the PSMC unit number 1-4
- `mode` is one of:
  - PSMC_SINGLE
  - PSMC_PUSH_PULL
  - PSMC_BRIDGE_PUSH_PULL
  - PSMC_PULSE_SKIPPING
  - PSMC_ECCP_BRIDGE_REVERSE
  - PSMC_ECCP_BRIDGE_FORWARD
  - PSMC_VARIABLE_FREQ
  - PSMC_3_PHASE

For complementary outputs use a or bar (!) and PSMC_COMPLEMENTARY

Normally the module is not started until the psmc_pins() call is made. To enable immediately or in PSMC_ENABLE_NOW.

- `period` has three parts or'ed together. The clock source, the clock divisor and the events that can cause the period to start.

**Sources:**

- PSMC_SOURCE_FOSC
- PSMC_SOURCE_64MHZ
- PSMC_SOURCE_CLK_PIN

**Divisors:**

- PSMC_DIV_1
- PSMC_DIV_2
Built-in Functions

- PSMC_DIV_4
- PSMC_DIV_8

Events:
- Use any of the events listed below.

period_time is the duration the period lasts in ticks. A tick is the above clock source divided by the divisor.

rising_edge is any of the following events to trigger when the signal goes active.

rise_time is the time in ticks that the signal goes active (after the start of the period) if the event is PSMC_EVENT_TIME, otherwise unused.

falling_edge is any of the following events to trigger when the signal goes inactive.

fall_time is the time in ticks that the signal goes inactive (after the start of the period) if the event is PSMC_EVENT_TIME, otherwise unused.

Events:
- PSMC_EVENT_TIME
- PSMC_EVENT_C1OUT
- PSMC_EVENT_C2OUT
- PSMC_EVENT_C3OUT
- PSMC_EVENT_C4OUT
- PSMC_EVENT_PIN_PIN

Returns: undefined

Function: Initializes a PSMC unit with the primary characteristics such as the type of PWM, the period, duty and various advanced triggers. Normally this call does not start the PSMC. It is expected all the setup functions be called and the psmc_pins() be called last to start the PSMC module. These two calls are all that are required for a simple PWM. The other functions may be used for advanced settings and to dynamically change the signal.

Availability: All devices equipped with PSMC module.

Requires: None

Examples:
// Simple PWM, 10kHz out on pin C0 assuming a 20mhz crystal
// Duty is initially set to 25%
setup_psmc(1, PSMC_SINGLE,
   PSMC_EVENT_TIME | PSMC_SOURCE_FOSC, us(100),
Example Files: None

Also See: psmc_deadband(), psmc_sync(), psmc_blanking(), psmc_modulation(), psmc_shutdown(), psmc_duty(), psmc_freq_adjust(), psmc_pins()

setup_power_pwm(
)

Syntax: setup_power_pwm(modes, postscale, time_base, period, compare,
compare_postscale, dead_time)

Parameters: modes values may be up to one from each group of the following:
PWM_CLOCK_DIV_4, PWM_CLOCK_DIV_16,
PWM_CLOCK_DIV_64, PWM_CLOCK_DIV_128

PWM_DISABLED, PWM_FREE_RUN, PWM_SINGLE_SHOT,
PWM_UP_DOWN, PWM_UP_DOWN_INT

PWM_OVERRIDE_SYNC

PWM_UP_TRIGGER,

PWM_DOWN_TRIGGER
PWM_UPDATE_DISABLE, PWM_UPDATE_ENABLE

PWM_DEAD_CLOCK_DIV_2,
PWM_DEAD_CLOCK_DIV_4,
PWM_DEAD_CLOCK_DIV_8,
PWM_DEAD_CLOCK_DIV_16

postscale is an integer between 1 and 16. This value sets the PWM
time base output postscale.

time_base is an integer between 0 and 65535. This is the initial value
of the PWM base

period is an integer between 0 and 4095. The PWM time base is
incremented until it reaches this number.

compare is an integer between 0 and 255. This is the value that the
PWM time base is compared to, to determine if a special event should
be triggered.
**compare_postscale** is an integer between 1 and 16. This postscaler affects compare, the special events trigger.

**dead_time** is an integer between 0 and 63. This value specifies the length of an off period that should be inserted between the going off of a pin and the going on of it is a complementary pin.

**Returns:** undefined

**Function:** Initializes and configures the motor control Pulse Width Modulation (PWM) module.

**Availability:** All devices equipped with motor control or power PWM module.

**Requires:** None

**Examples:**

```c
setup_power_pwm(PWM_CLOCK_DIV_4 | PWM_FREE_RUN | 
    PWM_DEAD_CLOCK_DIV_4,1,10000,1000,0,1,0);
```

**Example Files:** None

**Also See:**

- set_power_pwm_override()
- setup_power_pwm_pins()
- set_power_pwmX_duty()

### setup_power_pwm_pins()

**Syntax:**

```c
setup_power_pwm_pins(module0,module1,module2,module3)
```

**Parameters:** For each module (two pins) specify:
- PWM_PINS_DISABLED, PWM_ODD_ON, PWM_BOTH_ON, 
  PWM_COMPLEMENTARY

**Returns:** undefined

**Function:** Configures the pins of the Pulse Width Modulation (PWM) device.

**Availability:** All devices equipped with a power control PWM.

**Requires:** None

**Examples:**

```c
setup_power_pwm_pins(PWM_PINS_DISABLED, PWM_PINS_DISABLED, 
    PWM_PINS_DISABLED, 
    PWM_PINS_DISABLED);
```
```c
setup_power_pwm_pins(PWM_COMPLEMENTARY, 
    PWM_COMPLEMENTARY, PWM_PINS_DISABLED, 
    PWM_PINS_DISABLED);
```

**Example Files:** None

**Also See:**
- `setup_power_pwm()`,
- `set_power_pwm_override()`, `set_power_pwmX_duty()`

---

## setup_psp(option,address_mask)

**Syntax:**
```
setup_psp (options,address_mask);
setup_psp(options);
```

**Parameters:**
- **Option**: The mode of the Parallel slave port. This allows to set the slave port mode, read-write strobe options and other functionality of the PMP/EPMP module. See the devices .h file for all options. Some typical options include:
  - PAR_PSP_AUTO_INC
  - PAR_CONTINUE_IN_IDLE
  - PAR_INTR_ON_RW  //Interrupt on read write
  - PAR_INC_ADDR    //Increment address by 1 every read/write cycle
  - PAR_WAIT4       //4 Tcy Wait for data hold after strobe

- **address_mask**: This allows the user to setup the address enable register with a 16 bit or 32 bit (EPMP) value. This value determines which address lines are active from the available 16 address lines PMA0: PMA15 or 32 address lines PMA0:PMA31 (EPMP only).

**Returns:** Undefined.

**Function:** Configures various options in the PMP/EPMP module. The options are present in the device.h file and they are used to setup the module. The PMP/EPMP module is highly configurable and this function allows users to setup configurations like the Slave mode, Interrupt options, address increment/decrement options, Address enable bits and various strobe and delay options.

**Availability:** Only the devices with a built in Parallel Port module or Enhanced Parallel Master Port module.

**Requires:** Constants are defined in the devices .h file.
### Built-in Functions

**Examples:**
```
setup_psp(PAR_PSP_AUTO_INC|PAR_STOP_IN_IDLE,0x00FF );  //Sets up legacy slave mode with
//read and write buffers
//auto increment.
```

**Example Files:**
None

**Also See:**
`psp_output_full()`, `psp_input_full()`, `psp_overflow()`,
See header file for device selected.

### Syntax
```
setup_pwm1( ) setup_pwm2( )
setup_pwm3( ) setup_pwm4( )
```

**Parameters:**
```
settings- setup of the PWM module. See the device’s .h file for all options.
Some typical options include:

- PWM_ENABLED
- PWM_OUTPUT
- PWM_ACTIVE_LOW
```

**Returns:**
Undefined

**Function:**
Sets up the PWM module.

**Availability:**
On devices with a PWM module.

**Examples:**
```
setup_pwm1(PWM_ENABLED|PWM_OUTPUT);
```

**Example Files:**
None

**Also See:**
`set_pwm_duty()`

### Syntax
```
setup_qei( options, filter, maxcount );
```
### setup_qei()

**Syntax:**
```c
setup_qei(options, maxcount, filter, divisor, offset, mode);
```

| Parameters: | **Options**- The mode of the QEI module. See the devices .h file for all options
|-------------|---|
|             | Some common options are:
|             | · QEI_MODE_X2
|             | · QEI_MODE_X4
| **filter**  | This parameter is optional, the user can enable the digital filters and specify the clock divisor.
| **maxcount**| Specifies the value at which to reset the position counter.
| **Returns:**| `void`

### setup_rtc()

**Syntax:**
```c
setup_rtc(options, calibration);
```

| Parameters: | **Options**- The mode of the RTCC module. See the devices .h file for all options
|-------------|---|
|             | **Calibration**- This parameter is optional and the user can specify an 8 bit value that will get written to the calibration configuration register.
| **Returns:**| `void`

**Function:** Configures the Real Time Clock and Calendar module. The module requires an external 32.768 kHz clock crystal for operation.

**Availability:** Devices that have the RTCC module.

**Requires:** Nothing.
### Built-in Functions

**Examples:**

```c
class rtc
    setup_rtc(RTC_ENABLE | RTC_OUTPUT SECONDS, 0x00);
// Enable RTCC module with seconds clock and no calibration
```

**Example Files:** None

**Also See:**
- rtc_read()
- rtc_alarm_read()
- rtc_alarm_write()
- setup_rtc_alarm()
- rtc_write(), setup_rtc()

---

### setup_rtc_alarm()

**Syntax:**
```c
setup_rtc_alarm(options, mask, repeat);
```

**Parameters:**
- `options` - The mode of the RTCC module. See the devices .h file for all options
- `mask` - specifies the alarm mask bits for the alarm configuration.
- `repeat` - Specifies the number of times the alarm will repeat. It can have a max value of 255.

**Returns:**
- `void`

**Function:**
- Configures the alarm of the RTCC module.

**Availability:**
- Devices that have the RTCC module.

**Requires:**
- Nothing.

**Examples:**
```c
setup_rtc_alarm(RTC_ALARM_ENABLE, RTC_ALARM_HOUR, 3);
```

**Example Files:** None

**Also See:**
- rtc_read(), rtc_alarm_read(), rtc_alarm_write(), setup_rtc_alarm(),
- rtc_write(), setup_rtc()

---

### setup_smtx()

**Syntax:**
```c
setup_smt1(mode,[period]);
setup_smt2(mode,[period]);
```

**Parameters:**
- `mode` - The setup of the SMT module. See the device’s .h file for all

---

347
Some typical options include:

- SMT_ENABLED
- SMT_MODE_TIMER
- SMT_MODE_GATED_TIMER
- SMT_MODE_PERIOD_DUTY_CYCLE_ACQ

**period** - Optional parameter for specifying the overflow value of the SMT timer, defaults to maximum value if not specified.

**Returns:** Nothing

**Function:** Configures the Signal Measurement Timer (SMT) module.

**Availability:** Only devices with a built-in SMT module.

**Examples:**

```c
setup_smt1(SMT_ENABLED | SMT_MODE_PERIOD_DUTY_CYCLE_ACQ | SMT_REPEAT_DATA_ACQ_MODE | SMT_CLK_FOSC);
```

**Example Files:** None

**Also See:** smtx_status(), smtx_start(), smtx_stop(), smtx_update(), smtx_reset_timer(), smtx_read(), smtx_write()

### setup_spi() setup_spi2()

**Syntax:**

```c
setup_spi (mode)
setup_spi2 (mode)
```

**Parameters:**

- `mode` may be:
  - SPI_MASTER, SPI_SLAVE, SPI_SS_DISABLED
  - SPI_L_TO_H, SPI_H_TO_L
  - SPI_CLK_DIV_4, SPI_CLK_DIV_16,
  - SPI_CLK_DIV_64, SPI_CLK_T2
  - SPI_SAMPLES_AT_END, SPI_XMIT_L_TO_H
  - Constants from each group may be or'ed together

**Returns:** undefined

**Function:** Initializes the Serial Port Interface (SPI). This is used for 2 or 3 wire serial devices that follow a common clock/data protocol.

**Also See:** spi_write(), spi_read(), spi_data_is_in(), SPI Overview
**setup_timer_A( )**

Syntax:  
```c
setup_timer_A (mode);
```

Parameters:  
`mode` values may be:
- TA_OFF, TA_INTERNAL, TA_EXT_H_TO_L, TA_EXT_L_TO_H
- TA_DIV_1, TA_DIV_2, TA_DIV_4, TA_DIV_8, TA_DIV_16,
  TA_DIV_32,
  TA_DIV_64, TA_DIV_128, TA_DIV_256
- constants from different groups may be or'ed together with |.

Returns:  
undefined

Function:  
sets up Timer A.

Availability:  
This function is only available on devices with Timer A hardware.

Requires:  
Constants are defined in the device's .h file.

Examples:  
```c
setup_timer_A(TA_OFF);
setup_timer_A(TA_INTERNAL | TA_DIV_256);
setup_timer_A(TA_EXT_L_TO_H | TA_DIV_1);
```

Example Files:  
none

Also See:  
`get_timerA( ), set_timerA( ), TimerA Overview`

**setup_timer_B( )**

Syntax:  
```c
setup_timer_B (mode);
```

Parameters:  
`mode` values may be:
- TB_OFF, TB_INTERNAL, TB_EXT_H_TO_L, TB_EXT_L_TO_H
- TB_DIV_1, TB_DIV_2, TB_DIV_4, TB_DIV_8, TB_DIV_16,
  TB_DIV_32,
  TB_DIV_64, TB_DIV_128, TB_DIV_256
- constants from different groups may be or'ed together with |.

Returns:  
undefined

Function:  
sets up Timer B
### setup_timer_B( )

**Syntax:** `setup_timer_B (mode)`

**Parameters:** `mode` may be one or two of the constants defined in the devices .h file. RTCC_INTERNAL, RTCC_EXT_L_TO_H or RTCC_EXT_H_TO_L

- RTCC_DIV_2, RTCC_DIV_4, RTCC_DIV_8, RTCC_DIV_16,
- RTCC_DIV_32, RTCC_DIV_64, RTCC_DIV_128, RTCC_DIV_256

PIC18XXX only: RTCC_OFF, RTCC_8_BIT

One constant may be used from each group or'ed together with the | operator.

**Returns:** undefined

**Function:** Sets up the timer B (aka RTCC).

**Warning:** On older PIC16 devices, set-up of the prescaler may undo the WDT prescaler.

**Availability:** All devices.

**Requires:** Constants are defined in device's .h file.

**Examples:** `setup_timer_B(TB_OFF);`

- `setup_timer_B(TB_INTERNAL | TB_DIV_256);`
- `setup_timer_B(TA_EXT_L_TO_H | TB_DIV_1);`

**Example Files:** none

**Also See:** `get_timerB( ), set_timerB( ), TimerB Overview`
setup_timer_1( )

Syntax: setup_timer_1 (mode)

Parameters: mode values may be:
- T1_DISABLED, T1_INTERNAL, T1_EXTERNAL, T1EXTERNAL_SYNC
- T1_CLK_OUT
- T1_DIV_BY_1, T1_DIV_BY_2, T1_DIV_BY_4, T1_DIV_BY_8
- constants from different groups may be or’ed together with |.

Returns: undefined

Function: Initializes timer 1. The timer value may be read and written to using SET_TIMER1() and GET_TIMER1(). Timer 1 is a 16 bit timer.

With an internal clock at 20mhz and with the T1_DIV_BY_8 mode, the timer will increment every 1.6us. It will overflow every 104.8576ms.

Availability: This function is only available on devices with timer 1 hardware.

Requires: Constants are defined in the devices .h file.

Examples:
- setup_timer_1 ( T1_DISABLED );
- setup_timer_1 ( T1_INTERNAL | T1_DIV_BY_4 );
- setup_timer_1 ( T1_INTERNAL | T1_DIV_BY_8 );

Example Files:
Also See: get_timer1(), set_timer1(), Timer1 Overview

setup_timer_2( )

Syntax: setup_timer_2 (mode, period, postscale)

Parameters: mode may be one of:
- T2_DISABLED
- T2_DIV_BY_1, T2_DIV_BY_4, T2_DIV_BY_16

Period is a int 0-255 that determines when the clock value is reset
Postscale is a number 1-16 that determines how many timer overflows before an interrupt: (1 means once, 2 means twice, an so on)
**setup_timer_2( )**

Syntax: `setup_timer_2 (mode)`

Parameters: `Mode` may be one of the following constants from each group or'ed (via `|`) together:
- `T3_DISABLED, T3_INTERNAL, T3_EXTERNAL, T3_EXTERNAL_SYNC`
- `T3_DIV_BY_1, T3_DIV_BY_2, T3_DIV_BY_4, T3_DIV_BY_8`

Returns: undefined

Function: Initializes timer 2. The mode specifies the clock divisor (from the oscillator clock). The timer value may be read and written to using `GET_TIMER2()` and `SET_TIMER2()`. 2 is a 8-bit counter/timer.

Availability: This function is only available on devices with timer 2 hardware.

Requires: Constants are defined in the devices .h file.

Examples: `setup_timer_2 ( T2_DIV_BY_4, 0xc0, 2) //at 20mhz, the timer will increment every 800ns //will overflow every 154.4us, //and will interrupt every 308.us`

Also See: `get_timer2()`, `set_timer2()`, Timer2 Overview

---

**setup_timer_3( )**

Syntax: `setup_timer_3 (mode)`

Parameters: `Mode` may be one of the following constants from each group or'ed (via `|`) together:
- `T3_DISABLED, T3_INTERNAL, T3_EXTERNAL, T3_EXTERNAL_SYNC`
- `T3_DIV_BY_1, T3_DIV_BY_2, T3_DIV_BY_4, T3_DIV_BY_8`

Returns: undefined

Function: Initializes timer 3 or 4. The mode specifies the clock divisor (from the oscillator clock). The timer value may be read and written to using `GET_TIMER3()` and `SET_TIMER3()`. Timer 3 is a 16 bit counter/timer.

Availability: This function is only available on devices with timer 3 hardware.

Requires: Constants are defined in the devices .h file.

Examples: `setup_timer_3 (T3_INTERNAL | T3_DIV_BY_2);`
setup_timer_4()

Syntax: setup_timer_4 (mode, period, postscale)

Parameters: mode may be one of:
- T4_DISABLED, T4_DIV_BY_1, T4_DIV_BY_4, T4_DIV_BY_16

period is a int 0-255 that determines when the clock value is reset,

postscale is a number 1-16 that determines how many timer overflows before an interrupt: (1 means once, 2 means twice, and so on).

Returns: undefined

Function: Initializes timer 4. The mode specifies the clock divisor (from the oscillator clock).
The timer value may be read and written to using GET_TIMER4() and SET_TIMER4().
Timer 4 is a 8 bit counter/timer.

Availability: This function is only available on devices with timer 4 hardware.

Requires: Constants are defined in the devices .h file

Examples:
setup_timer_4 ( T4_DIV_BY_4, 0xc0, 2);
// At 20mhz, the timer will increment every 800ns,
// will overflow every 153.6us,
// and will interrupt every 307.2us.

Example Files: None
Also See: get_timer3(), set_timer3()
file.

T5_DISABLED, T5_INTERNAL, T5_EXTERNAL, or 
EXTERNAL_SYNC

T5_DIV_BY_1, T5_DIV_BY_2, T5_DIV_BY_4, T5_DIV_BY_8 

T5_ONE_SHOT, T5_DISABLE_SE_RESET, or 
T5_ENABLE_DURING_SLEEP

Returns: undefined

Function: Initializes timer 5. The mode specifies the clock divisor (from the oscillator clock). The timer value may be read and written to using GET_TIMER5() and SET_TIMER5(). Timer 5 is a 16 bit counter/timer.

Availability: This function is only available on devices with timer 5 hardware.

Requires: Constants are defined in the devices .h file.

Examples: setup_timer_5 (T5_INTERNAL | T5_DIV_BY_2);

Example Files: None

Also See: get_timer5(), set_timer5(), Timer5 Overview

**setup_uart()**

Syntax: 

```c
setup_uart(baud, stream)
ssetup_uart(baud)
ssetup_uart(baud, stream, clock)
```

Parameters: 

**baud** is a constant representing the number of bits per second. A one or zero may also be passed to control the on/off status. 

**Stream** is an optional stream identifier.

*Chips with the advanced UART may also use the following constants:*

UART_ADDRESS UART only accepts data with 9th bit=1

UART_DATA UART accepts all data

*Chips with the EUART H/W may use the following constants:*

UART_AUTODETECT Waits for 0x55 character and sets the UART baud rate to match.

UART_AUTODETECT_NOWAIT Same as above function, except
returns before 0x55 is received. KBHIT() will be true when the match is made. A call to GETC() will clear the character. UART_WAKEUP_ON_RDA Wakes PIC up out of sleep when RCV goes from high to low

**clock** - If specified this is the clock rate this function should assume. The default comes from the #USE DELAY.

**Returns:** undefined

**Function:** Very similar to SET_UART_SPEED. If 1 is passed as a parameter, the UART is turned on, and if 0 is passed, UART is turned off. If a BAUD rate is passed to it, the UART is also turned on, if not already on.

**Availability:** This function is only available on devices with a built in UART.

**Requires:** #USE RS232

**Examples:**

```c
setup_uart(9600);
setup_uart(9600, rsOut);
```

**Example Files:** None

**Also See:** #USE RS232, putc(), getc(), RS232 I/O Overview

### setup_vref( )

**Syntax:**

```c
setup_vref (mode | value )
```

**Parameters:**

- **mode** may be one of the following constants:
  - FALSE (off)
  - VREF_LOW for VDD*VALUE/24
  - VREF_HIGH for VDD*VALUE/32 + VDD/4
  - any may be or'ed with VREF_A2.

- **value** is an int 0-15.

**Also See:** Voltage Reference Overview
**setup_wdt()**

**Syntax:**

```
setup_wdt (mode)
```

**Parameters:**

Constants like: WDT_18MS, WDT_36MS, WDT_72MS, WDT_144MS, WDT_288MS, WDT_576MS, WDT_1152MS, WDT_2304MS

For some parts: WDT_ON, WDT_OFF

**Warning:**

On older PIC16 devices, set-up of the prescaler may undo the timer0 prescaler.

**Also See:**

#FUSES, restart_wdt(), WDT or Watch Dog Timer Overview, Internal Oscillator Overview

---

**setup_zdc()**

**Syntax:**

```
setup_zdc(mode);
```

**Parameters:**

`mode` - the setup of the ZDC module. The options for setting up the module include:

- ZCD_ENABLED
- ZCD_DISABLED
- ZCD_INVERTED
- ZCD_INT_L_TO_H
- ZCD_INT_H_TO_L

**Returns:**

Nothing

**Function:**

To set-up the Zero_Cross Detection (ZCD) module.

**Availability:**

All devices with a ZCD module.

**Examples:**

```
setup_zcd(ZCD_ENABLE|ZCD_INT_H_TO_L);
```

**Example Files:**

None

**Also See:**

zcd_status()
shift_left( )

### Function
Shifts a bit into an array or structure. The address may be an array identifier or an address to a structure (such as &data). Bit 0 of the lowest byte in RAM is treated as the LSB.

### Availability
All devices

### Requires
Nothing

```c
// reads 16 bits from pin A1, each bit is read // on a low to high on pin A2
struct {
    byte time;
    byte command : 4;
    byte source : 4;} msg;

for(i=0; i<=16; ++i) {
    while(!input(PIN_A2));
    shift_right(&msg,3,input(PIN_A1));
    while (input(PIN_A2)) ;}
```

### Examples
// This shifts 8 bits out PIN_A0, LSB first.
for(i=0; i<8; ++i)
    output_bit(PIN_A0, shift_right(&data,1,0));

### Example Files
- ex_extee.c
- 9356.c

### Also See
- shift_left()
- rotate_right()
- rotate_left()

---

## sleep()

### Syntax
```
sleep(mode)
```

### Parameters
- **mode** - for most chips this is not used. Check the device header for special options on some chips.

### Returns
Undefined

### Function
Issues a SLEEP instruction. Details are device dependent. However, in general the part will enter low power mode and halt program execution until woken by specific external events. Depending on the cause of the wake up execution may continue after the sleep instruction. The compiler inserts a sleep() after the last statement in main().

### Availability
All devices
<table>

<tr>
<td>Also See:</td>
<td>reset cpu()</td>
</tr>
</tbody>
</table>

**sleep_ulpwu( )**

**Syntax:**

```c
sleep_ulpwu(time)
```

**Parameters:**

`time` specifies how long, in us, to charge the capacitor on the ultra-low power wake-up pin (by outputting a high on PIN_B0).

**Returns:**

undefined

**Function:**

Charges the ultra-low power wake-up capacitor on PIN_B0 for `time` microseconds, and then puts the PIC to sleep. The PIC will then wake-up on an 'Interrupt-on-Change' after the charge on the cap is lost.

**Availability:**

Ultra Low Power Wake-Up support on the PIC (example, PIC124F32KA302)

**Requires:**

```
#define USE DELAY
```

```c
while(TRUE)
{
    if (input(PIN_A1))
        //do something
    else
        sleep_ulpwu(10);  //cap will be charged for 10us,
                          //then goto sleep
}
```

**Example Files:**

None

**Also See:**

```
#define USE DELAY
```
smtx_read( )

Syntax:  
value_smt1_read(which);
value_smt2_read(which);

Parameters:  
which - Specifies which SMT registers to read. The following defines have been made in the device’s header file to select which registers are read:
  SMT_CAPTURED_PERIOD_REG
  SMT_CAPTURED_PULSE_WIDTH_REG
  SMT_TMR_REG
  SMT_PERIOD_REG

Returns:  
32-bit value

Function:  
To read the Capture Period Registers, Capture Pulse Width Registers, Timer Registers or Period Registers of the Signal Measurement Timer module.

Availability:  
Only devices with a built-in SMT module.

Examples:  
unsigned int32 Period;
Period = smt1_read(SMT_CAPTURED_PERIOD_REG);

Example Files:  
None

Also See:  
smtx_status(), stmx_start(), smtx_stop(), smtx_update(),
smtx_reset_timer(),
setup_SMTx(), smtx_write()

smtx_reset_timer( )

Syntax:  
smt1_reset_timer();
smt2_reset_timer();

Parameters:  
None

Returns:  
Nothing

Function:  
To manually reset the Timer Register of the Signal Measurement Timer module.

Availability:  
Only devices with a built-in SMT module.
### smtx_start()

**Syntax:**

```c
smt1_start();
smt2_start();
```

**Parameters:** None

**Returns:** Nothing

**Function:** To have the Signal Measurement Timer (SMT) module start acquiring data.

**Availability:** Only devices with a built-in SMT module.

**Examples:**

```c
smt1_start();
```

**Example Files:** None

**Also See:**

- `setup_smtx()`, `smtx_start()`, `smtx_stop()`, `smtx_update()`, `smtx_status()`, `smtx_reset_timer()`, `smtx_read()`, `smtx_write()`

### smtx_status()

**Syntax:**

```c
value = smt1_status();
value = smt2_status();
```

**Parameters:** None

**Returns:** The status of the SMT module.

**Function:** To return the status of the Signal Measurement Timer (SMT) module.

**Availability:** Only devices with a built-in SMT module.

**Examples:**

```c
status = smt1_status();
```
### smtx_stop()

**Syntax:**
```
smt1_stop();
smt2_stop();
```

**Parameters:** None

**Returns:** Nothing

**Function:** Configures the Signal Measurement Timer (SMT) module.

**Availability:** Only devices with a built-in SMT module.

**Examples:**
```
smt1_stop()
```

### smtx_write()

**Syntax:**
```
smt1_write(which,value);
smt2_write(which,value);
```

**Parameters:**
- `which` - Specifies which SMT registers to write. The following defines have been made in the device's header file to select which registers are written:
  - `SMT_TMR_REG`
  - `SMT_PERIOD_REG`
- `value` - The 24-bit value to set the specified registers.

**Returns:** Nothing

**Function:** To write the Timer Registers or Period Registers of the Signal Measurement
## Timer (SMT) module

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### smtx_update()

**Syntax:**

```c
smt1_update(which);
smt2_update(which);
```

**Parameters:**

`which` - Specifies which capture registers to manually update. The following defines have been made in the device's header file to select which registers are updated:

- `SMT_CAPTURED_PERIOD_REG`
- `SMT_CAPTURED_PULSE_WIDTH_REG`

**Returns:**

Nothing

**Function:**

To manually update the Capture Period Registers or the Capture Pulse Width Registers of the Signal Measurement Timer module.

**Availability:**

Only devices with a built-in SMT module.

**Examples:**

```c
smt1_update(SMT_CAPTURED_PERIOD_REG);
```

**Example Files:**

None

**Also See:**

`setup_smtx()`, `stmx_start()`, `smtx_stop()`, `smtx_status()`, `smtx_reset_timer()`, `smtx_read()`, `smtx_write()`

### spi_data_is_in()  spi_data_is_in2()

**Syntax:**

```c
result = spi_data_is_in()
result = spi_data_is_in2()
```

**Parameters:**

None
### spi_init()

**Syntax:**

```c
spi_init(baud);
spi_init(stream, baud);
```

**Parameters:**

- `stream` – is the SPI stream to use as defined in the STREAM=name option in #USE SPI.
- `band` - the band rate to initialize the SPI module to. If FALSE it will disable the SPI module, if TRUE it will enable the SPI module to the band rate specified in #use SPI.

**Returns:**

Nothing.

**Function:**

Initializes the SPI module to the settings specified in #USE SPI.

**Availability:**

This function is only available on devices with SPI hardware.

**Requires:**

#USE SPI

```c
#use spi(MATER, SPI1, baud=1000000, mode=0, stream=SPI1_MODE0)
```

**Examples:**

```c
spi_init(SPI1_MODE0, TRUE); //initialize and enable SPI1 to setting in #USE SPI
spi_init(FALSE); //disable SPI1
spi_init(250000); //initialize and enable SPI1 to a baud rate of 250K
```

**Example Files:**

None
Also See: #USE SPI, spi_xfer(), spi_xfer_in(), spi_prewrite(), spi_speed()  

**spi_prewrite(data);**

**Syntax:**

```c
spi_prewrite(data);
spi_prewrite(stream, data);
```

**Parameters:**

- `stream` – the SPI stream to use as defined in the STREAM=name option in #USE SPI.
- `data` – the variable or constant to transfer via SPI

**Returns:**

Nothing.

**Function:**

Writes data into the SPI buffer without waiting for transfer to be completed. Can be used in conjunction with spi_xfer() with no parameters to transfer more than 8 bits for PCM and PCH device, or more than 8 bits or 16 bits (XFER16 option) for PCD. Function is useful when using the SSP or SSP2 interrupt service routines for PCM and PCH device, or the SPIx interrupt service routines for PCD device.

**Availability:**

This function is only available on devices with SPI hardware.

**Requires:**

#USE SPI, and the option SLAVE is used in #USE SPI to setup PIC as a SPI slave device

**Examples:**

```c
spi_prewrite(data_out);
```

**Example Files:**

`ex_spi_slave.c`

**Also See:** #USE SPI, spi_xfer(), spi_xfer_in(), spi_init(), spi_speed()  

**spi_read()**  **spi_read2()**

**Syntax:**

```c
value = spi_read ([data])
value = spi_read2 ([data])
```

**Parameters:**

- `data` – optional parameter and if included is an 8 bit int.

**Returns:**

An 8 bit int

**Function:**

Return a value read by the SPI. If a value is passed to the spi_read() the data will be clocked out and the data received will be
returned. If no data is ready, spi_read() will wait for the data is a
SLAVE or return the last DATA clocked in from spi_write().

If this device is the MASTER then either do a spi_write(data)
followed by a spi_read() or do a spi_read(data). These both do the
same thing and will generate a clock. If there is no data to send just
do a spi_read(0) to get the clock.

If this device is a SLAVE then either call spi_read() to wait for the
clock and data or use_spi_data_is_in() to determine if data is ready.
This function is only available on devices with SPI hardware.

Availability:
Requires: Nothing
Examples:
Example Files: ex_spi.c
Also See: spi_write(), , , spi_data_is_in(), SPI Overview

spi_read2_16()  spi_read3_16()
spi_read4_16()

Syntax:
value = spi_read_16([data]);
value = spi_read2_16([data]);
value = spi_read3_16([data]);
value = spi_read4_16([data]);

Parameters: data – optional parameter and if included is a 16 bit int

Returns: A 16 bit int

Function: Return a value read by the SPI. If a value is passed to the
spi_read_16() the data will be clocked out and the data received will
be returned. If no data is ready, spi_read_16() will wait for the data
is a SLAVE or return the last DATA clocked in from spi_write_16().
If this device is the MASTER then either do a spi_write_16(data)
followed by a spi_read_16() or do a spi_read_16(data). These both
do the same thing and will generate a clock. If there is no data to
send just do a spi_read_16(0) to get the clock.
If this device is a slave then either call spi_read_16() to wait for the
clock and data or use_spi_data_is_in() to determine if data is ready.

Availability: This function is only available on devices with SPI hardware.
### spi_speed

**Syntax:**

- `spi_speed(baud);`
- `spi_speed(stream, baud);`
- `spi_speed(stream, baud, clock);`

**Parameters:**

- `stream` – is the SPI stream to use as defined in the STREAM= option in `#USE SPI`.
- `band` – the band rate to set the SPI module to.
- `clock` – the current clock rate to calculate the band rate with. If not specified it uses the value specified in `#use delay()`.

**Returns:**

Nothing.

**Function:**

Sets the SPI module's baud rate to the specified value.

**Availability:**

This function is only available on devices with SPI hardware.

**Requires:**

`#USE SPI`

**Examples:**

- `spi_speed(250000);`
- `spi_speed(SPI1_MODE0, 250000);`
- `spi_speed(SPI1_MODE0, 125000, 8000000);`

**Example Files:**

None

**Also See:**

`#USE SPI, spi_xfer(), spi_xfer_in(), spi_prewrite(), spi_init()`

---

### spi_write()  spi_write2()

**Syntax:**

- `spi_write([wait], value);`
- `spi_write2([wait], value);`

**Parameters:**

- `value` is an 8 bit int
wait - an optional parameter specifying whether the function will wait for the SPI transfer to complete before exiting. Default is TRUE if not specified.

Returns: Nothing

Function: Sends a byte out the SPI interface. This will cause 8 clocks to be generated. This function will write the value out to the SPI. At the same time data is clocked out data is clocked in and stored in a receive buffer. spi_read() may be used to read the buffer.

Availability: This function is only available on devices with SPI hardware.

Requires: Nothing

Examples:

```c
spi_write( data_out );
data_in = spi_read();
```

Example Files: `ex_spi.c`

Also See: `spi_read()`, `spi_data_is_in()`, `SPI Overview`, `spi_write_16()`, `spi_read_16()`

---

**spi_xfer()**

Syntax:

```c
spi_xfer(data)
spi_xfer(stream, data)
spi_xfer(stream, data, bits)
result = spi_xfer(data)
result = spi_xfer(stream, data)
result = spi_xfer(stream, data, bits)
```

Parameters:

- `data` is the variable or constant to transfer via SPI. The pin used to transfer `data` is defined in the DO=pin option in #use spi.

- `stream` is the SPI stream to use as defined in the STREAM=name option in #USE SPI.

- `bits` is how many bits of data will be transferred.

Returns: The data read in from the SPI. The pin used to transfer result is defined in the DI=pin option in #USE SPI.

Function: Transfers data to and reads data from an SPI device.
**Built-in Functions**

### Availability:
All devices with SPI support.

### Requires:
#USE SPI

```c
int i = 34;
spi_xfer(i);
// transfers the number 34 via SPI
```

### Examples:
```c
int trans = 34, res;
res = spi_xfer(trans);
// transfers the number 34 via SPI
// also reads the number coming in from SPI
```

### Example Files:
None

### Also See:
#USE SPI

---

**SPI_XFER_IN()**

### Syntax:
value = spi_xfer_in();
value = spi_xfer_in(bits);
value = spi_xfer_in(stream,bits);

### Parameters:
- **stream** – is the SPI stream to use as defined in the STREAM=name option in #USE SPI.
- **bits** – is how many bits of data to be received.

### Returns:
The data read in from the SPI

### Function:
Reads data from the SPI, without writing data into the transmit buffer first.

### Availability:
This function is only available on devices with SPI hardware.

### Requires:
#USE SPI, and the option SLAVE is used in #USE SPI to setup PIC as a SPI slave device.

### Examples:
```c
data_in = spi_xfer_in();
```

### Example Files:
ex_spi_slave.c

### Also See:
#USE SPI, spi_xfer(), spi_prewrite(), spi_init(), spi_speed()

---

**sprintf( )**

### Syntax:
`sprintf(string, cstring, values...);`
bytes=sprintf(string, cstring, values...)

**Parameters:**
- `string` is an array of characters.
- `cstring` is a constant string or an array of characters null terminated.
- `Values` are a list of variables separated by commas. Note that format specifies do not work in ram band strings.

**Returns:**
Bytes is the number of bytes written to string.

**Function:**
This function operates like printf() except that the output is placed into the specified string. The output string will be terminated with a null. No checking is done to ensure the string is large enough for the data. See printf() for details on formatting.

**Availability:**
All devices.

**Requires:**
Nothing

```c
char mystring[20];
long mylong;

mylong=1234;
sprintf(mystring,"<%lu",mylong);
// mystring now has:
//    < 1 2 3 4 > \0
```

**Example Files:**
None

**Also See:**
printf()
### Built-in Functions

**Domain error occurs in the following cases:**
- `sqrt`: when the argument is negative

**Availability:** All devices.

**Requires:**
- `#INCLUDE <math.h>`

**Examples:**
- `distance = sqrt( pow((x1-x2),2)+pow((y1-y2),2) );`

**Example Files:** None

**Also See:** None

---

### `srand()`

**Syntax:**
- `srand(n)`

**Parameters:**
- `n` is the seed for a new sequence of pseudo-random numbers to be returned by subsequent calls to `rand`.

**Returns:** No value.

**Function:**
- The `srand()` function uses the argument as a seed for a new sequence of pseudo-random numbers to be returned by subsequent calls to `rand`. If `srand()` is then called with same seed value, the sequence of random numbers shall be repeated. If `rand` is called before any call to `srand()` have been made, the same sequence shall be generated as when `srand()` is first called with a seed value of 1.

**Availability:** All devices.

**Requires:**
- `#INCLUDE <STDLIB.H>`

**Examples:**
- `srand(10);`
- `I=rand();`

**Example Files:** None

**Also See:** `rand()`
## STANDARD STRING FUNCTIONS

- `memchr()`
- `memcmp()`
- `strcat()`
- `strchr()`
- `strcmp()`
- `strcoll()`
- `strcspn()`
- `strerror()`
- `stricmp()`
- `strlen()`
- `strlwr()`
- `strncat()`
- `strncmp()`
- `strncpy()`
- `strpbrk()`
- `strrchr()`
- `strspn()`
- `strstr()`
- `strxfrm()`

### Syntax:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ptr=strcat(s1,s2)</code></td>
<td>Concatenate <code>s2</code> onto <code>s1</code></td>
</tr>

</tr>
<tr>
<td><code>ptr=memchr(m1,c,n)</code></td>
<td>Find <code>c</code> in first <code>n</code> characters of <code>m1</code> and return <code>&amp;m1[i]</code></td>
</tr>
<tr>
<td><code>ptr=strerror(errnum)</code></td>
<td>Maps the error number in <code>errnum</code> to an error message string. The parameters 'errnum' is an unsigned 8 bit int. Returns a pointer to the string.</td>
</tr>
</tbody>
</table>

### Parameters:

- `s1` and `s2` are pointers to an array of characters (or the name of an
**Build-in Functions**

array). Note that s1 and s2 MAY NOT BE A CONSTANT (like "hi").

\( n \) is a count of the maximum number of character to operate on.

\( c \) is a 8 bit character

\( m1 \) and \( m2 \) are pointers to memory.

**Returns:**

- \( \text{ptr} \) is a copy of the s1 pointer
- \( \text{result} \) is an 8 bit int
- \( \text{result} \) is -1 (less than), 0 (equal) or 1 (greater than)
- \( \text{res} \) is an integer.

**Function:**

Functions are identified above.

**Availability:**

All devices.

**Requires:**

```
#include <string.h>
```

```c
char string1[10], string2[10];
strcpy(string1,"hi ");
strcpy(string2,"there" );
strcat(string1,string2);
printf("Length is %u\r\n", strlen(string1));
   // Will print 8
```

**Example Files:** ex_str.c

**Also See:** strcpy(), strtok()
### CCS C Compiler

</thead>
</table>

| Also See:      | strxxxx() |

---

### `strtod()`

**Syntax:**

```c
result=strtod(nptr,& endptr)
```

**Parameters:**

`nptr` and `endptr` are strings

**Returns:**

result is a float.
returns the converted value in result, if any. If no conversion could be performed, zero is returned.

**Function:**

The `strtod` function converts the initial portion of the string pointed to by `nptr` to a float representation. The part of the string after conversion is stored in the object pointed to `endptr`, provided that `endptr` is not a null pointer. If `nptr` is empty or does not have the expected form, no conversion is performed and the value of `nptr` is stored in the object pointed to by `endptr`, provided `endptr` is not a null pointer.

**Availability:**

All devices.

**Requires:**

```c
#include <stdlib.h>
```

```c
float result;
char str[12]="123.45hello";
char *ptr;
result=strtod(str,&ptr);
//result is 123.45 and ptr is "hello"
```

### Example Files:
None
Also See: `strtol()`, `strtoul()`

### strtok()

**Syntax:**

```c
ptr = strtok(s1, s2)
```

**Parameters:**

- `s1` and `s2` are pointers to an array of characters (or the name of an array). Note that `s1` and `s2` MAY NOT BE A CONSTANT (like "hi"). `s1` may be 0 to indicate a continue operation.

**Returns:**

- `ptr` points to a character in `s1` or is 0

**Function:**

- Finds next token in `s1` delimited by a character from separator string `s2` (which can be different from call to call), and returns pointer to it.

  - First call starts at beginning of `s1` searching for the first character NOT contained in `s2` and returns null if there is none are found.
  
  - If none are found, it is the start of first token (return value). Function then searches from there for a character contained in `s2`.
  
  - If none are found, current token extends to the end of `s1`, and subsequent searches for a token will return null.
  
  - If one is found, it is overwritten by '\0', which terminates current token. Function saves pointer to following character from which next search will start.
  
  - Each subsequent call, with 0 as first argument, starts searching from the saved pointer.

**Availability:**

- All devices.

**Requires:**

```c
#include <string.h>
```

```c
char string[30], term[3], *ptr;
strcpy(string,"one,two,three;");
strcpy(term,";,;");
```

**Examples:**

```c
ptr = strtok(string, term);
while(ptr!=0) {
    puts(ptr);
    ptr = strtok(0, term);
}
```

// Prints:

```
one
```
Example Files:  

Also See:  

**strtol( )**

Syntax:

\[
\text{result} = \text{strtol}(\text{nptr}, \& \text{endptr}, \text{base})
\]

Parameters:

- `nptr` and `endptr` are strings and `base` is an integer

Returns:

- `result` is a signed long int.
- Returns the converted value in `result`, if any. If no conversion could be performed, zero is returned.

Function:

The `strtol` function converts the initial portion of the string pointed to by `nptr` to a signed long int representation in some radix determined by the value of `base`. The part of the string after conversion is stored in the object pointed to `endptr`, provided that `endptr` is not a null pointer. If `nptr` is empty or does not have the expected form, no conversion is performed and the value of `nptr` is stored in the object pointed to by `endptr`, provided `endptr` is not a null pointer.

Availability:

All devices.

Requires:

- `#INCLUDE <stdlib.h>`

Examples:

```c
signed long result;
char str[9]="123hello";
char *ptr;
result=strtol(str,&ptr,10);
//result is 123 and ptr is "hello"
```

Example Files:  

Also See:  

**strtol( )**

Syntax:

\[
\text{result} = \text{strtol}(\text{nptr, endptr, base})
\]
### Built-in Functions

| Parameters: | nptr and endptr are strings pointers and base is an integer 2-36. |
| Returns: | result is an unsigned long int. returns the converted value in result, if any. If no conversion could be performed, zero is returned. |
| Function: | The strtoul function converts the initial portion of the string pointed to by nptr to a long int representation in some radix determined by the value of base. The part of the string after conversion is stored in the object pointed to endptr, provided that endptr is not a null pointer. If nptr is empty or does not have the expected form, no conversion is performed and the value of nptr is stored in the object pointed to by endptr, provided endptr is not a null pointer. |
| Availability: | All devices. |
| Requires: | STDLIB.H must be included |

```c
long result;
char str[9]="123hello";
char *ptr;
result=strtoul(str,&ptr,10);
//result is 123 and ptr is "hello"
```

### Example Files:
None

### Also See:
strtol(), strtod()

---

## swap( )

### Syntax:
`swap (lvalue)`

### Parameters:
`lvalue` is a byte variable

### Returns:
undefined - WARNING: this function does not return the result

### Function:
Swaps the upper nibble with the lower nibble of the specified byte. This is the same as:
```
byte = (byte << 4) | (byte >> 4);
```
### tolower( )

#### Syntax:

\[
\text{result} = \text{tolower}\ (\text{cvalue})
\]

#### Parameters:

\text{cvalue} is a character

#### Returns:

An 8 bit character

#### Function:

These functions change the case of letters in the alphabet.

TOLOWER(X) will return 'a'..'z' for X in 'A'..'Z' and all other characters are unchanged. TOUPPER(X) will return 'A'..'Z' for X in 'a'..'z' and all other characters are unchanged.

#### Availability:

All devices.

#### Requires:

Nothing

#### Examples:

```c
switch( toupper(getc()) ) {
    case 'R' : read_cmd();  break;
    case 'W' : write_cmd(); break;
    case 'Q' : done=TRUE;   break;
}
```

#### Example Files:

ex_str.c

#### Also See:

None

---

### toupper( )

#### Syntax:

\[
\text{result} = \text{toupper}\ (\text{cvalue})
\]

#### Parameters:

\text{cvalue} is a character

#### Returns:

An 8 bit character

#### Function:

These functions change the case of letters in the alphabet.

TOLOWER(X) will return 'a'..'z' for X in 'A'..'Z' and all other characters are unchanged. TOUPPER(X) will return 'A'..'Z' for X in 'a'..'z' and all other characters are unchanged.

#### Availability:

All devices.

#### Requires:

Nothing

#### Examples:

```c
switch( toupper(getc()) ) {
    case 'R' : read_cmd();  break;
    case 'W' : write_cmd(); break;
    case 'Q' : done=TRUE;   break;
}
```

#### Example Files:

ex_str.c

#### Also See:

None
touchpad_getc( )

Syntax:          input = TOUCHPAD_GETC( );

Parameters:     None

Returns:        char (returns corresponding ASCII number is “input” declared as int)

Function:       Actively waits for firmware to signal that a pre-declared Capacitive Sensing Module (CSM) or charge time measurement unit (CTMU) pin is active, then stores the pre-declared character value of that pin in “input”.

        Note: Until a CSM or CTMU pin is read by firmware as active, this instruction will cause the microcontroller to stall.

Availability:   All PIC's with a CSM or CTMU Module

Requires:       #USE TOUCHPAD (options)

        //When the pad connected to PIN_B0 is activated, store the letter 'A'

        #USE TOUCHPAD (PIN_B0='A')
        void main(void){
                char c;
                enable_interrupts(GLOBAL);

                c = TOUCHPAD_GETC();
                //will wait until one of declared pins is detected
                //if PIN_B0 is pressed, c will get value 'A'
        }

Examples:       None

Also See:       #USE TOUCHPAD, touchpad_state( )

touchpad_hit( )

Syntax:          value = TOUCHPAD_HIT( )

Parameters:     None
Returns: TRUE or FALSE

Function: Returns TRUE if a Capacitive Sensing Module (CSM) or Charge Time Measurement Unit (CTMU) key has been pressed. If TRUE, then a call to touchpad_getc() will not cause the program to wait for a key press.

Availability: All PIC's with a CSM or CTMU Module

Requires: #USE TOUCHPAD (options)

Examples:
```c
// When the pad connected to PIN_B0 is activated, store the letter 'A'

#define TOUCHPAD_HIT() TRUE
#define TOUCHPAD_GETC() c

void main(void){
    char c;
    enable_interrupts(GLOBAL);
    while (TRUE) {
        if (TOUCHPAD_HIT())
            //wait until key on PIN_B0 is pressed
        c = TOUCHPAD_GETC(); //get key that was pressed
        //c will get value 'A'
    }
}
```

Example Files: None

Also See: #USE TOUCHPAD (), touchpad_state(), touchpad_getc()

touchpad_state()

Syntax: TOUCHPAD_STATE (state);

Parameters: state is a literal 0, 1, or 2.

Returns: None

Function: Sets the current state of the touchpad connected to the Capacitive Sensing Module (CSM). The state can be one of the following three values:

- 0 : Normal state
- 1 : Calibrates, then enters normal state
- 2 : Test mode, data from each key is collected in the int16 array
TOUCHDATA

Note: If the state is set to 1 while a key is being pressed, the touchpad will not calibrate properly.

Availability: All PIC’s with a CSM Module

Requires: #USE TOUCHPAD (options)

```c
#USE TOUCHPAD (THRESHOLD=5, PIN_D5='5', PIN_B0='C')
void main(void){
    char c;
    TOUCHPAD_STATE(1);  //calibrates, then enters
    normal state
    enable_interrupts(GLOBAL);
    while(1){
        c = TOUCHPAD_GETC();
        //will wait until one of declared pins is
detected
    }
    //if PIN_B0 is pressed, c will get value
    'C'
    }
    //if PIN_D5 is pressed, c will get value
    '5',
}
```

Examples: None

Also See: #USE TOUCHPAD, touchpad_getc(), touchpad_hit()

tax_buffer_available()

Syntax: `value = tx_buffer_available([stream]);`

Parameters: `stream` – optional parameter specifying the stream defined in #USE RS232.

Returns: Number of bytes that can still be put into transmit buffer

Function: Function to determine the number of bytes that can still be put into transmit buffer before it overflows. Transmit buffer is implemented has a circular buffer, so be sure to check to make sure there is room for at least one more then what is actually needed.

Availability: All devices
CCS C Compiler

**Requires:**  
#USE RS232

```c
#define USE_RS232(UART1, BAUD=9600, TRANSMIT_BUFFER=50)

void main(void) {
    unsigned int8 Count = 0;

    while(TRUE)
    {
        if(tx_buffer_available()>13)
            printf("/r/nCount=%3u",Count);
    }
}
```

**Examples:**

```c
void main(void) {
    unsigned int8 Count = 0;

    while(TRUE)
    {
        if(tx_buffer_available()>13)
            printf("/r/nCount=%3u",Count);
    }
}
```

**Example Files:**  
None

**Also See:**  
_USE_RS232(), rcv(), TX_BUFFER_FULL(), RCV_BUFFER_BYTES(), GET(), PUTC(), PRINTF(), SETUP_UART(), PUTC_SEND()

---

**tx_buffer_bytes()**

**Syntax:**  
`value = tx_buffer_bytes([stream]);`

**Parameters:**  
stream – optional parameter specifying the stream defined in #USE RS232.

**Returns:**  
Number of bytes in transmit buffer that still need to be sent.

**Function:**

Function to determine the number of bytes in transmit buffer that still need to be sent.

**Availability:**  
All devices

**Requires:**  
#USE RS232

```c
#define USE_RS232(UART1, BAUD=9600, TRANSMIT_BUFFER=50)

void main(void) {
    char string[] = "Hello";
    if(tx_buffer_bytes() <= 45)
        printf("%s",string);
}
```

**Example Files:**  
None

**Also See:**  
_USE_RS232(), RCV_BUFFER_FULL(), TX_BUFFER_FULL(), RCV_BUFFER_BYTES(), GET(), PUTC(), PRINTF(),
### tx_buffer_full( )

**Syntax:**  
\[ \text{value} = \text{tx_buffer_full}([\text{stream}]) \]

**Parameters:**  
\[ \text{stream} \] – optional parameter specifying the stream defined in `#USE RS232`

**Returns:**  
TRUE if transmit buffer is full, FALSE otherwise.

**Function:**  
Function to determine if there is room in transmit buffer for another character.

**Availability:**  
All devices

**Requires:**  
`#USE RS232`

```
#USE_RS232(UART1,BAUD=9600,TRANSMIT_BUFFER=50)
void main(void) {
    char c;
    if(!tx_buffer_full())
        putc(c);
}
```

**Example Files:**  
None

**Also See:**  
`_USE_RS232( ), RCV_BUFFER_FULL( ), TX_BUFFER_FULL( ), RCV_BUFFER_BYTES( ), GETC( ), PUTC( ), PRINTF( ), SETUP_UART( ), PUTC_SEND( )`

### va_arg( )

**Syntax:**  
\[ \text{va_arg} \left( \text{argptr, type} \right) \]

**Parameters:**  
\[ \text{argptr} \] is a special argument pointer of type va_list  
\[ \text{type} \] – This is data type like int or char.

**Returns:**  
The first call to va_arg after va_start return the value of the
parameters after that specified by the last parameter. Successive
invocations return the values of the remaining arguments in
succession.

**Function:**
The function will return the next argument every time it is called.

**Availability:**
All devices.

**Requires:**
```
#include <stdarg.h>
```

**Examples:**
```c
int foo(int num, ...)
{
    int sum = 0;
    int i;
    va_list argptr; // create special argument pointer
    va_start(argptr, num); // initialize argptr
    for(i=0; i<num; i++)
        sum = sum + va_arg(argptr, int);
    va_end(argptr); // end variable processing
    return sum;
}
```

**Example Files:**
None

**Also See:**
nargs(), va_end(), va_start()

---

**va_end( )**

**Syntax:**
```
va_end(argptr)
```

**Parameters:**
`argptr` is a special argument pointer of type `va_list`.

**Returns:**
None

**Function:**
A call to the macro will end variable processing. This will facilitate a
normal return from the function whose variable argument list was
referred to by the expansion of `va_start()`.

**Availability:**
All devices.

**Requires:**
```
#include <stdarg.h>
```

**Examples:**
```c
int foo(int num, ...)
{
    int sum = 0;
```
Built-in Functions

```c
int i;
va_list argptr; // create special argument pointer
va_start(argptr,num); // initialize argptr
for(i=0; i<num; i++)
    sum = sum + va_arg(argptr, int);
va_end(argptr);    // end variable processing
return sum;
```

**Example Files:** None

**Also See:** `nargs()`, `va_start()`, `va_arg()`

---

**va_start**

**Syntax:**

```c
va_start(argptr, variable)
```

**Parameters:**

- `argptr` is a special argument pointer of type `va_list`
- `variable` – The second parameter to `va_start()` is the name of the last parameter before the variable-argument list.

**Returns:** None

**Function:**

The function will initialize the `argptr` using a call to the macro `va_start()`.

**Availability:** All devices.

**Requires:** `#INCLUDE <stdarg.h>`

```c
int foo(int num, ...)
{
    int sum = 0;
    int i;
    va_list argptr; // create special argument pointer
    va_start(argptr,num); // initialize argptr
    for(i=0; i<num; i++)
        sum = sum + va_arg(argptr, int);
    va_end(argptr);    // end variable processing
    return sum;
}
```

**Examples:** None

**Also See:** `nargs()`, `va_start()`, `va_arg()"
**write_bank( )**

**Syntax:**

```plaintext
write_bank (bank, offset, value)
```

**Parameters:**

- `bank` is the physical RAM bank 1-3 (depending on the device)
- `offset` is the offset into user RAM for that bank (starts at 0)
- `value` is the 8 bit data to write

**Returns:**

undefined

**Function:**

Write a data byte to the user RAM area of the specified memory bank. This function may be used on some devices where full RAM access by auto variables is not efficient. For example on the PIC16C57 chip setting the pointer size to 5 bits will generate the most efficient ROM code however auto variables can not be above 1Fh. Instead of going to 8 bit pointers you can save ROM by using this function to write to the hard to reach banks. In this case the bank may be 1-3 and the offset may be 0-15.

**Availability:**

All devices but only useful on PCB parts with memory over 1Fh and PCM parts with memory over FFh.

**Requires:**

Nothing

```plaintext
i=0;       // Uses bank 1 as a RS232 buffer
do {
    c=getc();
    write_bank(1,i++,c);
} while (c!=0x13);
```

**Example Files:**

`ex_psp.c`

**Also See:**

See the "Common Questions and Answers" section for more information.

**write_configuration_memory( )**

**Syntax:**

```plaintext
write_configuration_memory ([offset], dataptr,count)
```

**Parameters:**

- `dataptr`: pointer to one or more bytes
- `count`: a 8 bit integer
**offset** is an optional parameter specifying the offset into configuration memory to start writing to, offset defaults to zero if not used.

**Returns:** undefined

**Function:**
- For PIC18 devices: Erases all fuses and writes count bytes from the dataptr to the configuration memory.
- For Enhanced16 devices: Erases and writes User ID memory.

**Availability:** All PIC18 Flash and Enhanced16 devices

**Requires:** Nothing

**Examples:**
```c
int data[6];
write_configuration_memory(data, 6)
```

**Example Files:** None

**Also See:** write_program_memory(), Configuration Memory Overview

---

**write_eeprom( )**

**Syntax:**
```
write_eeprom (address, value)
```

**Parameters:**
- **address** is a (8 bit or 16 bit depending on the part) int, the range is device dependent
- **value** is an 8 bit int

**Returns:** undefined

**Function:**
Write a byte to the specified data EEPROM address. This function may take several milliseconds to execute. This works only on devices with EEPROM built into the core of the device.

For devices with external EEPROM or with a separate EEPROM in the same package (like the 12CE671) see EX_EXTEE.c with CE51X.c, CE61X.c or CE67X.c.

In order to allow interrupts to occur while using the write operation, use the #DEVICE option WRITE_EEPROM = NOINT. This will allow interrupts to occur while the write_eeprom() operations is polling the done bit to check if the write operations has completed. Can be used as long as no EEPROM operations are performed during an
ISR.

**Availability:**
This function is only available on devices with supporting hardware on chip.

**Requires:**
Nothing

**Examples:**
```c
#define LAST_VOLUME 10  // Location in EEPROM
volume++;
write_eeprom(LAST_VOLUME, volume);
```

**Example Files:**
ex_intee.c, ex_extee.c, ce51x.c, ce62x.c, ce67x.c

**Also See:**
read_eeprom(), write_program_eeprom(), read_program_eeprom(),
data Eeprom Overview

---

### write_external_memory( )

**Syntax:**
write_external_memory( address, dataptr, count )

**Parameters:**
- **address** is 16 bits on PCM parts and 32 bits on PCH parts
- **dataptr** is a pointer to one or more bytes
- **count** is a 8 bit integer

**Returns:**
undefined

**Function:**
Writes count bytes to program memory from dataptr to address. Unlike write_program_eeprom() and read_program_eeprom() this function does not use any special EEPROM/FLASH write algorithm. The data is simply copied from register address space to program memory address space. This is useful for external RAM or to implement an algorithm for external flash.

**Availability:**
Only PCH devices.

**Requires:**
Nothing

**Examples:**
```c
for(i=0x1000;i<=0x1fff;i++) {
    value=read_adc();
    write_external_memory(i, value, 2);
    delay_ms(1000);
}
```

**Example Files:**
ex_load.c, loader.c
### write_extended_ram()

**Syntax:**
```
write_extended_ram (page, address, data, count);
```

**Parameters:**
- `page` – the page in extended RAM to write to
- `address` – the address on the selected page to start writing to
- `data` – pointer to the data to be written
- `count` – the number of bytes to write (0-32768)

**Returns:** undefined

**Function:** To write data to the extended RAM of the PIC.

**Availability:** On devices with more than 30K of RAM.

**Requires:** Nothing

**Examples:**
```
unsigned int8 data[8] = {0x01,0x02,0x03,0x04,0x05,0x06,0x07,0x08};
write_extended_ram(1,0x0000,data,8);
```

**Example Files:** None

**Also See:** read_extended_ram(), Extended RAM Overview

### write_program_eeprom()

**Syntax:**
```
write_program_eeprom (address, data)
```

**Parameters:**
- `address` is 16 bits on PCM parts and 32 bits on PCH parts, `data` is 16 bits. The least significant bit should always be 0 in PCH.

**Returns:** undefined

**Function:** Writes to the specified program EEPROM area.

- See our write_program_memory() for more information on this function.

**Availability:** Only devices that allow writes to program memory.
## write_program_memory()

### Syntax:

`write_program_memory( address, dataptr, count );`

### Parameters:

- **address**: is 16 bits on PCM parts and 32 bits on PCH parts.
- **dataptr**: is a pointer to one or more bytes.
- **count**: is a 8 bit integer on PIC16 and 16-bit for PIC18.

### Returns:

undefined

### Function:

Writes count bytes to program memory from dataptr to address. This function is most effective when count is a multiple of `FLASH_WRITE_SIZE`. Whenever this function is about to write to a location that is a multiple of `FLASH_ERASE_SIZE` then an erase is performed on the whole block.

### Availability:

Only devices that allow writes to program memory.

### Requires:

Nothing

### Examples:

```c
for(i=0x1000;i<=0x1fff;i++) {
    value=read_adc();
    write_program_memory(i, value, 2);
    delay_ms(1000);
}
```

### Example Files:

- `loader.c`

### Also See:

- `write_program_eeprom`
- `erase_program_eeprom`
- Program Eeprom Overview

### Additional Notes:

Clarification about the functions to write to program memory:

In order to get the desired results while using `write_program_memory()`, the block of memory being written to...
needs to first be read in order to save any other variables currently stored there, then erased to clear all values in the block before the new values can be written. This is because the write_program_memory() function does not save any values in memory and will only erase the block if the first location is written to. If this process is not followed, when new values are written to the block, they will appear as garbage values.

For chips where getenv("FLASH_ERASE_SIZE") > getenv("FLASH_WRITE_SIZE")

write_program_eeprom() - Writes 2 bytes, does not erase (use erase_program_eeprom())

write_program_memory() - Writes any number of bytes, will erase a block whenever the first (lowest) byte in a block is written to. If the first address is not the start of a block that block is not erased.

erase_program_eeprom() - Will erase a block. The lowest address bits are not used.

For chips where getenv("FLASH_ERASE_SIZE") = getenv("FLASH_WRITE_SIZE")

write_program_eeprom() - Writes 2 bytes, no erase is needed.

write_program_memory() - Writes any number of bytes, bytes outside the range of the write block are not changed. No erase is needed.

erase_program_eeprom() - Not available

---

**zdc_status( )**

**Syntax:**

value=zcd_status()

**Parameters:**

*None*

**Returns:**

value - the status of the ZCD module. The following defines are made in the device's header file and are as follows:

- ZCD_IS_SINKING
- ZCD_IS_SOURCING
<table>
<thead>
<tr>
<th><strong>Function:</strong></th>
